**RE: Site Plan and Conditional Use Permit Application**  
**Case # LU-20-259**  
**375 Banfield Road, Portsmouth, NH**  
**Tax Map 266, Lot 7**  
**JBE Project No. 19190.2**

Dear Mr. Stith,

Jones & Beach Engineers, Inc., respectfully submits a Site Plan application on behalf of the applicant, Banfield Realty, LLC. The intent of this application is to construct an industrial warehouse and office building with associated grading, drainage, and utilities. This project is to be served by electric, gas, septic system, and municipal water. We finally have the approvals from EPA and NHDES so we are resubmitting documents to TAC so we can be put on the agenda for the June 6<sup>th</sup> meeting.

The following items are provided in support of this Application:

1. Completed Site Plan Permit Checklist.
2. Letter of Authorization.
3. Current Deed.
4. Test Pits.
5. NHDES AoT Permit-2040.
6. Septic Approval.
7. NHDES Wetland Permit 2021-00240.
8. Traffic Memorandum.
9. Supplemental Site Investigative Report (Electronic Copy Only).
10. EPA Approval of PCB Remediation – undated.
11. Revised Work Plan for Lowland Area by Wilcox & Barton – dated 4/5/23
12. Acceptance of Remedial Action Plan by Wilcox & Barton – dated 4/7/23
13. NHDES Remedial Action Plan approval – dated 4/26/23
14. Work Plan for Lowland Area, Revision 2 – dated 5/16/23
15. Photos of Similar Style Building.
16. One (1) Full Size Plan Sets Folded.
17. One (1) Drainage Analysis.

If you have any questions or need any additional information, please feel free to contact our office. Thank you very much for your time.

Very truly yours,  
**JONES & BEACH ENGINEERS, INC.**

## Site Plan Application Checklist

This site plan application checklist is a tool designed to assist the applicant in the planning process and for preparing the application for Planning Board review. A pre-application conference with a member of the planning department is strongly encouraged as additional project information may be required depending on the size and scope. The applicant is cautioned that this checklist is only a guide and is not intended to be a complete list of all site plan review requirements. Please refer to the Site Plan review regulations for full details.

**Applicant Responsibilities (Section 2.5.2):** Applicable fees are due upon application submittal along with required attachments. The application shall be complete as submitted and provide adequate information for evaluation of the proposed site development. Waiver requests must be submitted in writing with appropriate justification.

### WARRANTY DEED

KNOW ALL PERSONS BY THESE PRESENTS, that we, **William E. Copeland** a married man of 26 Constitution Way, Dover, NH 03820, **Jack Copeland** a single man of 245 Middle Street, Apartment #227, Portsmouth, NH 03801, **Kevin Copeland** a single man of P.O. Box 4213, Valley Village, CA 91617, **Joseph P. Copeland**, married man of 142 Dennett Road, Kittery, ME 03904, and **Roeseland Holdings 5, LLC**, a New Hampshire limited liability company with an address of 21 Moody Point Drive, Newmarket, NH 03857, grant to **Banfield Realty LLC**, a New Hampshire limited liability company with an address of 304 Maplewood Avenue, Portsmouth, NH 03801, **with warranty covenants**, all our right, title and interest in the following described premises:

A certain lot or parcel of land together with the buildings thereon situated on the Southeasterly sideline of Banfield Road in Portsmouth, County of Rockingham and State of New Hampshire, bounded and described as follows:

Commencing at a point on said Southeasterly sideline of Banfield Road at the intersection of two stone walls and at land now or formerly of one Barratt; thence running in a Southeasterly direction by and along an old stone wall and land now or formerly of said Barratt, Thompson, Pickering, Iafolla, Wood and Myers, a total distance of Two Thousand Six Hundred Sixty-Three feet (2,663') more or less to a point at the intersection of two stone walls; thence turning and running by and along a stone wall and land of Myers N 58° 22' E, a distance of One Hundred Twenty-Eight feet (128') to other land of Iafolla; thence turning and running by and along another stone wall and land of Iafolla, S 18° 21' E, a distance of Three Hundred Twenty feet (320'); thence turning and running by and along another stone wall S 54° 8' 30" W, a distance of Thirty feet (30'); thence turning and running by a stone wall S 47° 49' 30" E, a distance of One Hundred Seven feet (107') to a point adjoining land of Peverly Hill Corp., thence turning and running S 70° 15' W, a distance of Five Hundred Thirty-Three feet (533') to a point; thence turning and running N 25° 11' W, a distance of Three Hundred Twenty-Five feet (325') to a point at an old stone wall; thence turning and running in a Southwesterly direction by and along said stone wall and land of said Peverly Hill Corp. and also by land of Stef, a distance of Four Hundred Forty-Six feet (446') to a point; thence turning and running in a Northwesterly direction by a stone wall and land of Stef, a distance of One Thousand Four Hundred Ninety-Five feet (1,495') more or less to a point; thence turning and running S 65° 16' W, a distance of Ninety-Two feet (92') also by land of Stef to a point adjoining land now or formerly of Dow; thence turning and running N 25° 31' W, a distance of One Hundred Seventy-Five feet (175') to a point; thence continuing N 33° 50' W, a distance of Three Hundred and Eighteen feet (318') to a point; thence continuing N 35° 25' W, a distance of

Four Hundred Five feet (405') to a point adjoining land of Copeland; thence turning and running N 64° 17' E, a distance of Three Hundred Sixty feet (360') to a point; thence turning and running N 33° 21' W, a distance of Two Hundred feet (200'), the last two courses by land of Copeland, to a point at an old stone wall on the Southeasterly sideline of Banfield Road; thence turning and running by said stone wall N 63° 50' E, a distance of One Hundred Twenty-Nine feet (129'); thence continuing N 60° 28' E, a distance of Three Hundred Ten feet (310'); thence continuing N 61° 1' E, a distance of One Hundred Twenty-One feet (121') to the stone wall and point of beginning.

Excepting and excluding from this conveyance that portion of the above-described premises previously conveyed by warranty deed of William H. Copeland and Virginia A. Copeland to John Iafolla Co., Inc. dated September 3, 1963, recorded in Rockingham County Registry of Deeds at Book 1686, Page 133.

Subject to a right of way Fifty feet (50') in width lying along the Northeasterly sideline of the premises herein conveyed, and adjoining a stone wall designating said boundary, for access from Banfield Road to property conveyed by William H. Copeland and Virginia A. Copeland to John Iafolla Co., Inc. by warranty deed dated September 3, 1963, recorded in Rockingham County Registry of Deeds at Book 1686, Page 133.

Meaning and intending to describe and convey a portion of the same premises conveyed by Harry Zaitland and Irving Zaitland to William H. Copeland and Virginia A. Copeland by warranty deed dated September 3, 1963, recorded in Rockingham County Registry of Deeds at Book 1686, Page 128. William H. Copeland conveyed his interest in the premises to Virginia A. Copeland by quitclaim deed dated March 15, 2001, recorded in Rockingham County Registry of Deeds at Book 3555, Page 0083. Virginia A. Copeland died on September 10, 2008. See Estate of Virginia A. Copeland, 10<sup>th</sup> Circuit – Probate Division – Brentwood, Case No. 318-2008-ET-01202. Virginia A. Copeland's interest in the premises passed to the grantors William E. Copeland, Jack Copeland, Kevin Copeland and to James R. Copeland, who died on June 4, 2018. See Estate of James R. Copeland, 10<sup>th</sup> Circuit – Probate Division – Brentwood, Case No. 318-2018-ET-01138. James R. Copeland's interest in the premises passed to his sons, Joseph P. Copeland and James W. Copeland. James W. Copeland conveyed his portion of the premises to Roeseland Holdings 5, LLC, by Quitclaim Deed dated May 7, 2019, recorded in Rockingham County Registry of Deeds at Book 5998, Page 2778.

The premises conveyed hereby is not homestead property of the Grantors.

Executed this 5<sup>th</sup> day of February, 2020.

**Permit: AoT-2040**

RE: Industrial Warehouse  
Tax Map 266, Lot 7  
Portsmouth, NH

Dear Applicant:

Based upon the plans and application, approved on October 28, 2021, we are hereby issuing RSA 485-A:17 Alteration of Terrain Permit AoT-2040. The permit is subject to the following conditions:

As part of the processing of this application, DES waived specific requirements of Rule Env-Wq 1507.04 requiring the applicant to capture and infiltrate the groundwater recharge volume (GRV) in accordance with Env-Wq 1508.16 and Env-Wq 1507.05 Channel Protection Requirements. Granting these waivers will not have an adverse impact on the environment, public health, public safety, or abutting properties, and granting the request is consistent with the intent and purpose of the rules waived. Additional documentation relative to the waivers is contained within the file.

**PROJECT SPECIFIC CONDITIONS:**

1. The approved plans, latest revision dated October 26, 2021, and supporting documentation in the permit file are a part of this approval.
2. **This permit expires on October 28, 2026.** No earth moving activities shall occur on the project after this expiration date unless the permit has been extended by the Department. If requesting an extension, the request must be received by the department before the permit expires. The Amendment Request form is available at: <https://www.des.nh.gov/land/land-development>
3. The Permittee shall comply with all recommendations by the New Hampshire Fish and Game Department related to state or federally listed threatened or endangered species that are incorporated into the project plans.

[www.des.nh.gov](http://www.des.nh.gov)

29 Hazen Drive • PO Box 95 • Concord, NH 03302-0095  
(603) 271-3503 • TDD Access: Relay NH 1-800-735-2964

4. A soil management plan (SMP) shall be submitted to NHDES that describes the management of soil during upcoming site redevelopment activities, to include excavation activities, any temporary onsite storage, reuse, and any offsite disposal of soil conducted in accordance with Env-Or 611. Commencement of redevelopment activities that involve disturbance of soil shall not occur until NHDES has reviewed the SMP.

**GENERAL CONDITIONS:**

1. Activities shall not cause or contribute to any violations of the surface water quality standards established in Administrative Rule Env-Wq 1700.
2. You must submit revised plans for permit amendment prior to any changes in construction details or sequences. You must notify the Department in writing within ten days of a change in ownership.
3. You must notify the Department in writing prior to the start of construction and upon completion of construction. Forms can be submitted electronically at: <https://www.des.nh.gov/land/land-development> Paper forms are available at that same web page.
4. **All stormwater practices shall be inspected and maintained in accordance with Env-Wq 1507.07 and the project Inspection and Maintenance (I&M) Manual.** All record keeping required by the I&M Manual shall be maintained by the identified responsible party, and be made available to the department upon request. Photographs of the site and BMPs must accompany the I&M submittals.
5. This permit does not relieve the applicant from the obligation to obtain other local, state or federal permits that may be required (e.g., from US EPA, US Army Corps of Engineers, etc.). Projects disturbing over 1 acre may require a federal stormwater permit from EPA. Information regarding this permitting process can be obtained at: use <https://www.epa.gov/npdes/epas-2017-construction-general-permit-cgp-and-related-documents>.
6. In accordance with Env-Wq 1503.21 (c)(1), a written notice signed by the permit holder and a qualified engineer shall be submitted to DES stating that the project was completed in accordance with the approved plans and specifications. If deviations were made, the permit holder shall review the requirements in Env-Wq 1503.21(c)(2).
7. If applicable, no activity shall occur in wetland areas until a Wetlands Permit is obtained from the Department. Issuance of this permit does not obligate the Department to approve a Wetlands Permit for this project.

8. This project has been screened for potential impact to known occurrences of protected species and exemplary natural communities in the immediate area. Since many areas have never been surveyed, or have not been surveyed in detail, unidentified sensitive species or communities may be present. This permit does not absolve the permittee from due diligence in regard to state, local or federal laws regarding such communities or species. This permit does not authorize in any way the take of threatened or endangered species, as defined by RSA 212-A:2, or of any protected species or exemplary natural communities, as defined in RSA 217-A:3.

Sincerely,

Gloria S. Andrews, PE

NHDES Web Site: [www.des.nh.gov](http://www.des.nh.gov)

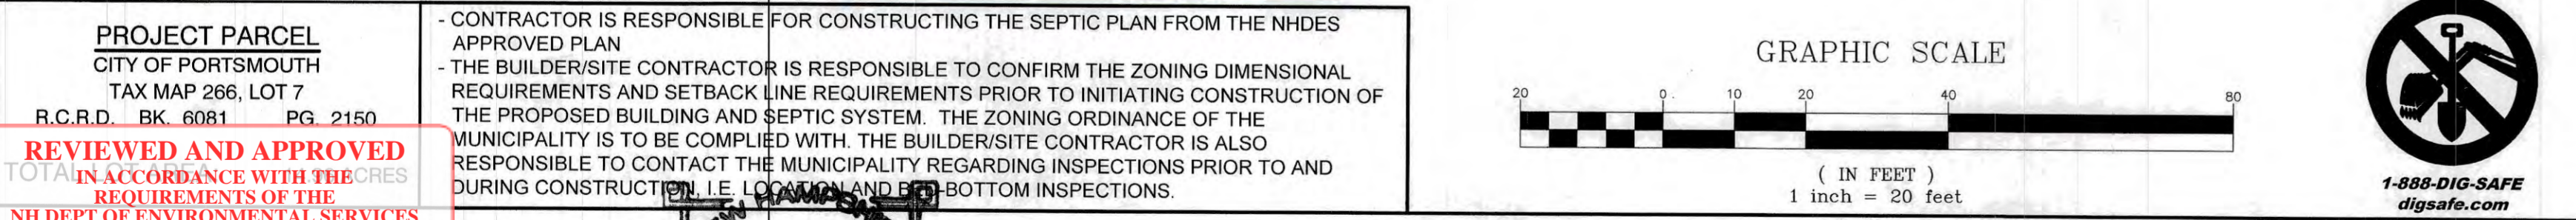

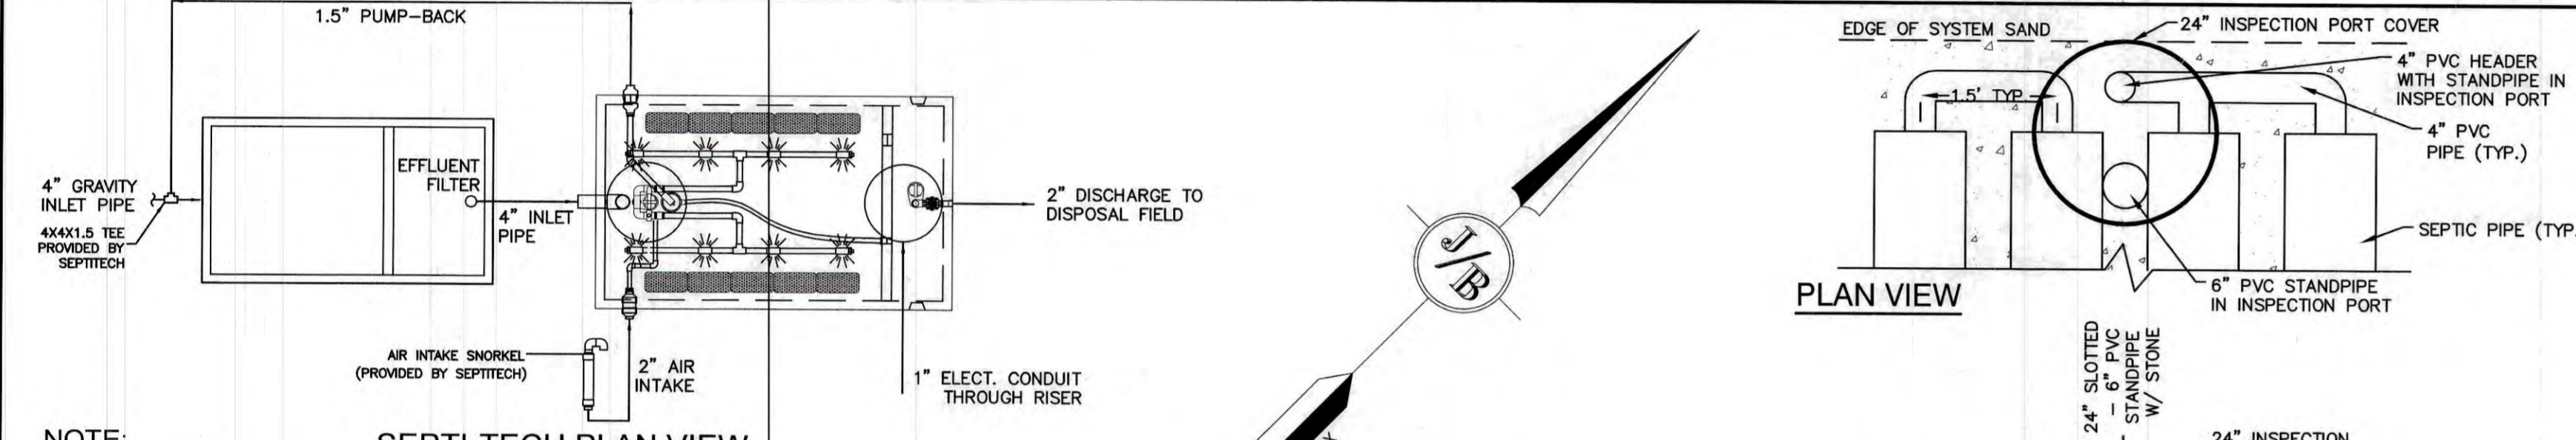

P.O. Box 95, 29 Hazen Drive, Concord, New Hampshire 03302-0095

Telephone: (603) 271-3503 Fax: (603) 271-6683 TDD Access: Relay NH 1-800-735-2964

**VI. GENERAL TERMS AND CONDITIONS:** Applicable to all Approvals for Construction

- A. This Approval for Construction is issued to construct the ISDS as identified on Page 1 of this Approval.
- B. This Approval is valid until 10/29/2025, unless an Approval for Operation has been granted.
- C. By exercising any rights under this approval, the parties have agreed to all terms and conditions.
- D. No liability is incurred by the State of New Hampshire by reason of any approval of any Approval for Construction. Approval by the Department of Environmental Services of sewage and waste disposal systems is based on plans and specifications supplied by the Applicant.
- E. The system must be constructed in strict accordance with the approved plans and specifications.
- F. The installed system must be left uncovered and cannot be used after construction until it is inspected and has received an Approval for Operation of Individual Sewage Disposal System (ISDS) by an authorized agent of the Department.
- G. This system must be installed by an installer holding a valid permit. An owner may install the system for his or her domicile. Env-Wq 1002.18 defines "Domicile" as that place where an individual has his or her true, fixed, and permanent home and principal establishment, and to which, whenever he or she is absent, he or she has the intention of returning. An individual might have more than one residence, but has only one domicile. Accordingly, an owner may only install a replacement system and may not install the system at a property he or she intends to make their future domicile. A person's domicile is considered to be at the address listed on his or her driver's license and/or where he or she is registered to vote.**
- H. This Approval for Construction does not supersede any equivalent or more stringent local ordinances or regulations. State standards are minimal and must be met statewide.

### STONE & PIPE DESIGN CALCULATIONS

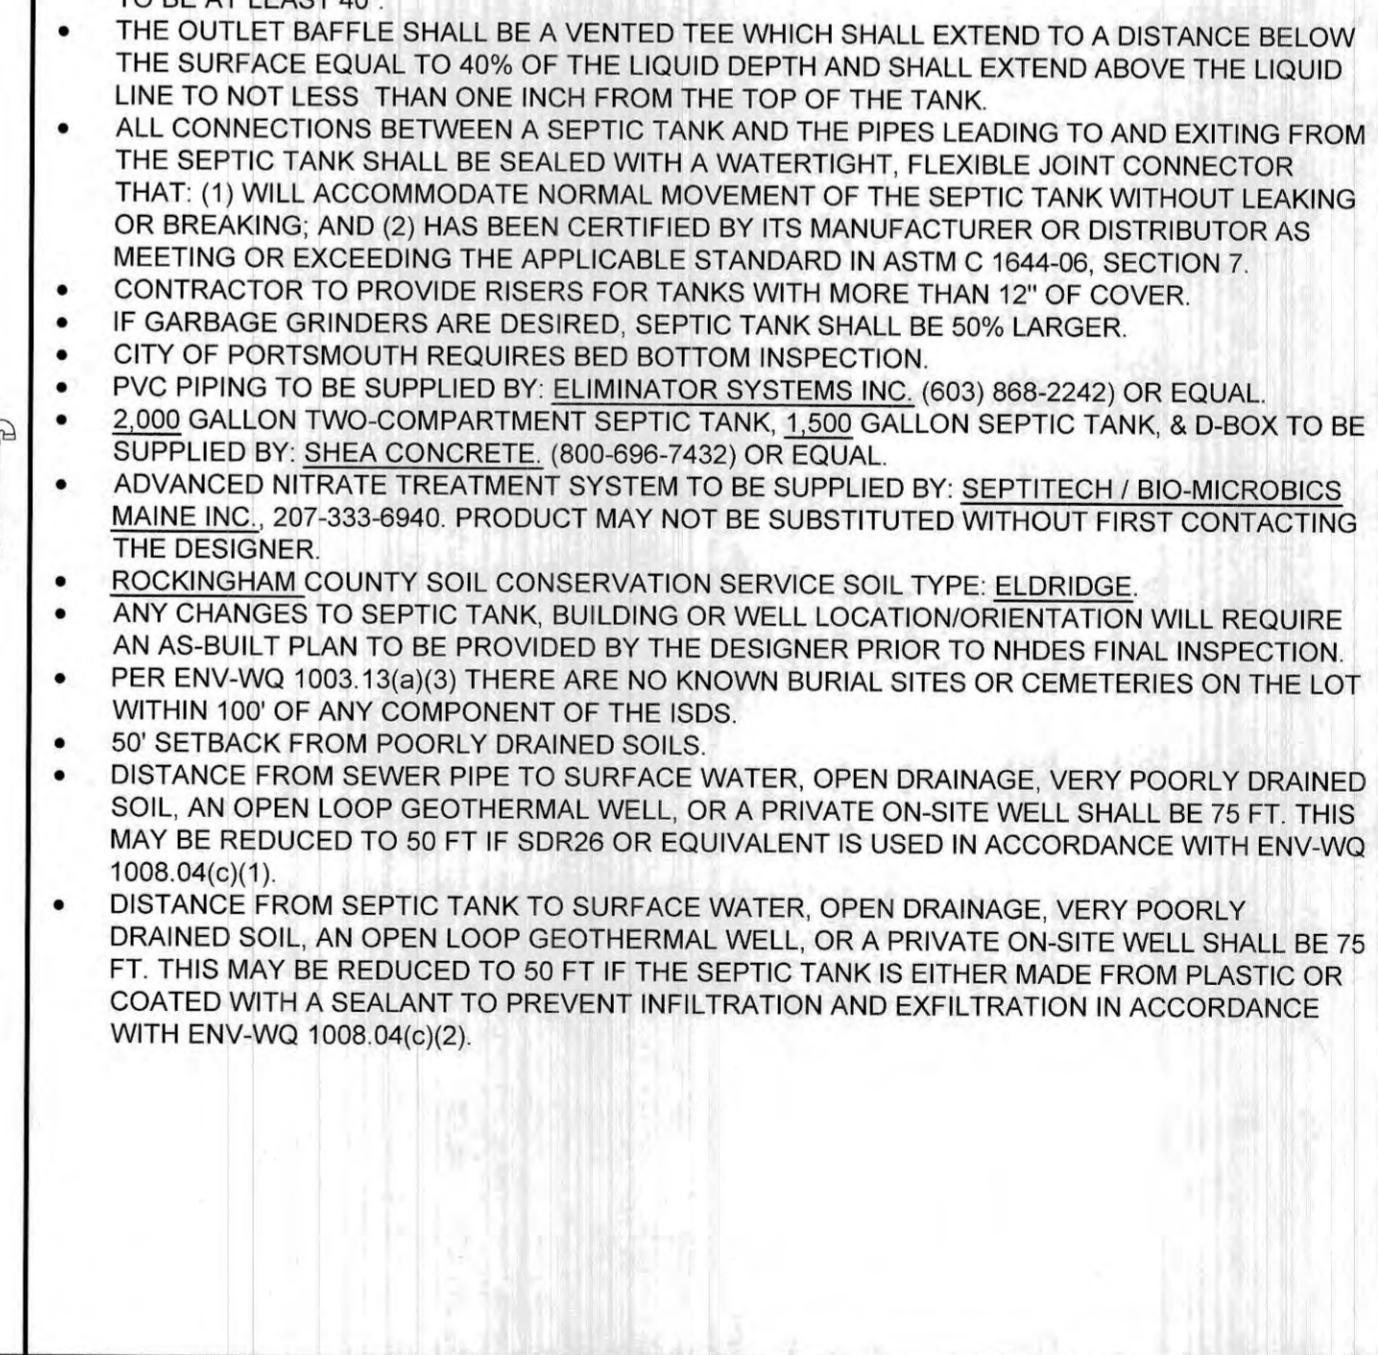

WAREHOUSE: 70 EMPLOYEES = 700 GPD  
OFFICE WITH CAFETERIA: 17 EMPLOYEES = 255 GPD (15 GPD / PERSON, PER ENV-WQ 1008-1)

955 GPD @ 16 MIN/INCH = 2,148 S.F. REQUIRED PER ENV-WQ 1016-1.  
2,148 S.F. x 75% PRE-TREATMENT REDUCTION = 637 S.F. REQUIRED.  
600 S.F. PROVIDED (SEE DIMENSIONS BELOW)

DESIGN INTENT: THE BOTTOM OF THE EFFLUENT DISPOSAL SYSTEM (E.D.S.) SHALL BE CONSTRUCTED AT ELEVATION 50.00. THIS IS APPROXIMATELY 5.00 FT ABOVE ORIGINAL GROUND ON THE HIGH CONTOUR (45.00) OF THE DESIGNED E.D.S. (ENV-WQ-1003.13(aa))

### GENERAL NOTES

- CONTRACTOR TO VERIFY ALL ELEVATIONS IN FIELD PRIOR TO CONSTRUCTION. CONTRACTOR TO NOTIFY DESIGNER OF ANY ABNORMAL CONDITIONS (HARDPAN OR SATURATED SOILS, LEDGE, ETC.) FOUND WHEN EXCAVATING PRIOR TO INSTALLATION OF THE SYSTEM.
- PER ENV-WQ 1016.03, CONTRACTOR IS TO PROTECT THE NATURAL ABSORPTION QUALITIES OF THE SOIL. DO NOT COMPACT OR DRIVE OVER THE AREA WITH EQUIPMENT AND PROTECT OPEN EXCAVATION TO PREVENT THE ENTRANCE OF SILT AND DEBRIS.
- FILL TO BE MEDIUM TO COURSE-TEXTURED SAND (0.5mm-2.0mm).
- REMOVE TOPSOIL BEFORE PLACING FILL.
- 4 INCH THICK LOAM & SEED AROUND PERIMETER OF FILL.
- CONTRACTOR TO INSTALL A VENT WHEN PROVIDING MORE THAN 18" OF COVER.
- VENTING IS REQUIRED FOR PUMP SYSTEMS.
- SLOPE SYSTEM AWAY FROM BUILDING.
- SYSTEM WILL BE REPLACED IN SAME LOCATION IN CASE OF FAILURE.
- JOINTS ARE TO BE BELLED PVC OR STANDARD SLIP COLLARS.
- PER ENV-WQ 1010.11, THE FIRST COMPARTMENT IN MULTI-COMPARTMENT SEPTIC TANKS MUST BE AT LEAST 2/3 OF THE REQUIRED VOLUME.
- PER ENV-WQ 1010.10, EXCEPTING LEDGE TANKS, THE LIQUID DEPTH OF THE SEPTIC TANK IS TO BE AT LEAST 40".
- THE OUTLET BAFFLE SHALL BE A VENTED TEE WHICH SHALL EXTEND TO A DISTANCE BELOW THE SURFACE EQUAL TO 40% OF THE LIQUID DEPTH AND SHALL EXTEND ABOVE THE LIQUID LINE TO NOT LESS THAN ONE INCH FROM THE TOP OF THE TANK.
- ALL CONNECTIONS BETWEEN A SEPTIC TANK AND THE PIPES LEADING TO AND EXITING FROM THE SEPTIC TANK SHALL BE SEALED WITH A WATERTIGHT, FLEXIBLE JOINT CONNECTOR THAT: (1) WILL ACCOMMODATE NORMAL MOVEMENT OF THE SEPTIC TANK WITHOUT LEAKING OR BREAKING; AND (2) HAS BEEN CERTIFIED BY ITS MANUFACTURER OR DISTRIBUTOR AS MEETING OR EXCEEDING THE APPLICABLE STANDARD IN ASTM C 1644-06, SECTION 7.
- CONTRACTOR TO PROVIDE RISERS FOR TANKS WITH MORE THAN 12" OF COVER.
- IF GARBAGE GRINDERS ARE DESIRED, SEPTIC TANK SHALL BE 50% LARGER.
- CITY OF PORTSMOUTH REQUIRES BED BOTTOM INSPECTION.
- PVC PIPING TO BE SUPPLIED BY: ELIMINATOR SYSTEMS INC. (603) 868-2242 OR EQUAL.
- 2,000 GALLON TWO-COMPARTMENT SEPTIC TANK, 1,500 GALLON SEPTIC TANK, & D-BOX TO BE SUPPLIED BY: SHEA CONCRETE, (800-696-7432) OR EQUAL.
- ADVANCED NITRATE TREATMENT SYSTEM TO BE SUPPLIED BY: SEPTITECH / BIO-MICROBICS MAINE INC. 207-333-6940. PRODUCT MAY NOT BE SUBSTITUTED WITHOUT FIRST CONTACTING THE DESIGNER.
- ROCKINGHAM COUNTY SOIL CONSERVATION SERVICE SOIL TYPE: ELDRIDGE.
- ANY CHANGES TO SEPTIC TANK, BUILDING OR WELL LOCATION/ORIENTATION WILL REQUIRE AN AS-BUILT PLAN TO BE PROVIDED BY THE DESIGNER PRIOR TO NHDES FINAL INSPECTION.
- PER ENV-WQ 1003.13(a)(3) THERE ARE NO KNOWN BURIAL SITES OR CEMETERIES ON THE LOT WITHIN 100' OF ANY COMPONENT OF THE ISDS.
- 50' SETBACK FROM POORLY DRAINED SOILS.
- DISTANCE FROM SEWER PIPE TO SURFACE WATER, OPEN DRAINAGE, VERY POORLY DRAINED SOIL, AN OPEN LOOP GEOTHERMAL WELL, OR A PRIVATE ON-SITE WELL SHALL BE 75 FT. THIS MAY BE REDUCED TO 50 FT IF SDR26 OR EQUIVALENT IS USED IN ACCORDANCE WITH ENV-WQ 1008.04(c)(1).
- DISTANCE FROM SEPTIC TANK TO SURFACE WATER, OPEN DRAINAGE, VERY POORLY DRAINED SOIL, AN OPEN LOOP GEOTHERMAL WELL, OR A PRIVATE ON-SITE WELL SHALL BE 75 FT. THIS MAY BE REDUCED TO 50 FT IF THE SEPTIC TANK IS EITHER MADE FROM PLASTIC OR COATED WITH A SEALANT TO PREVENT INFILTRATION AND EXFILTRATION IN ACCORDANCE WITH ENV-WQ 1008.04(c)(2).

### WETLAND DELINEATION

WETLANDS ON-SITE WERE DELINEATED BY: GOVE ENVIRONMENTAL SERVICES, INC. 8 CONTINENTAL DRIVE, UNIT H EXETER, NH 03833

DATE: SPRING, 2020

### OWNER NOTES

- KNOW THE LOCATION OF YOUR SEPTIC TANK AND LEACHING AREA.
- INSPECT YOUR SEPTIC TANK YEARLY. HAVE THE SEPTIC TANK PUMPED AS NEEDED BUT AT LEAST ONCE EVERY THREE YEARS.
- DO NOT FLUSH BULKY ITEMS SUCH AS DIAPERS, SANITARY PADS OR BABY WIPES.
- DO NOT FLUSH TOXIC CHEMICALS SUCH AS PAINT THINNERS, DRANO, PESTICIDES, OR CHLORINE, AS THEY MAY KILL THE NECESSARY BACTERIA IN THE SEPTIC TANK.
- REPAIR LEAKING FIXTURES IN THE BUILDING PROMPTLY.
- BE CONSERVATIVE WITH WATER USE. SPREAD OUT USE OVER TIME, AND USE WATER-REDUCING FIXTURES WHENEVER AND WHEREVER POSSIBLE. TOO MUCH USE IN A SHORT TIME CAN OVERLOAD THE SYSTEM, WHICH MAY LEAD TO FAILURE.
- MOW YOUR LEACHING AREA REGULARLY. PREVENT DEEP-ROOTED TREES AND SHRUBS FROM GROWING ON AND ADJACENT TO YOUR LEACHING AREA.
- NO VEHICULAR TRAVEL, LIVESTOCK TRAVEL, OR SNOW REMOVAL IN AREA OF SYSTEM.

### REFERENCES

APPROVAL FOR CONSTRUCTION IS VALID FOR 4 YEARS FROM DATE OF ISSUE

- PREV. CONSTRUCTION APPROVAL #CA1998009388 ISSUED: 06/03/1998.

**WETLANDS AND NON-SITE SPECIFIC PERMIT 2021-00240**

<b>PERMITTEE:</b>	<b>BANFIELD REALTY LLC 304 MAPLEWOOD AVE PORTSMOUTH NH 03801</b>	<b>NOTE CONDITIONS</b>
<b>PROJECT LOCATION</b>	<b>375 BANFIELD RD, PORTSMOUTH TAX MAP #266, LOT #7</b>	
<b>WATERBODY:</b>	<b>UNNAMED WETLAND</b>	
<b>APPROVAL DATE:</b>	<b>DECEMBER 06, 2021</b>	<b>EXPIRATION DATE: DECEMBER 06, 2026</b>

---

Based upon review of permit application 2021-00240 in accordance with RSA 482-A and RSA 485-A:17, the New Hampshire Department of Environmental Services (NHDES) hereby issues this Wetlands and Non-Site Specific Permit. To validate this Permit, signatures of the Permittee and the Principal Contractor are required.

**PERMIT DESCRIPTION:**

Dredge and fill 1,910 square feet of palustrine scrub-shrub wetland for commercial lot development.

**THIS PERMIT IS SUBJECT TO THE FOLLOWING PROJECT-SPECIFIC CONDITIONS:**

1. All work shall be done in accordance with the approved plans dated April 21, 2020 and revised through October 26, 2021 by Jones & Beach Engineers, Inc., last received by the NH Department of Environmental Services (NHDES) on November 04, 2021, in accordance with Env-Wt 307.16 and Env-Wt 524.05(b).
2. The permittee shall submit a construction notice with the department at least 48 hours prior to commencing work, in accordance with Env-Wt 524.05(a).
3. Prior to the start of construction, all on-site personnel shall be made aware of the potential to encounter threatened or endangered species, per Env-Wt 311.06(g).
4. All observations of threatened or endangered species shall be reported immediately to the New Hampshire Fish and Game Department (NHFG) Nongame and Endangered Wildlife Environmental Review Program by phone at 603-271-2461 and by email at NHFGreview@wildlife.nh.gov.
  1. Email subject line: NHB20-3122 Portsmouth Industrial Warehouse, Wildlife Species Observation.
  2. Photographs shall be provided for verification as feasible, per Env-Wt 311.06(g).
5. Water quality control measures shall be comprised of wildlife-friendly erosion control materials, not to be composed of welded plastic, in accordance with Env-Wt 307.03(c)(2).
6. The final disposition of all dredged contaminated soil and construction related debris shall be placed outside of areas subject to RSA 482-A jurisdiction and done so in coordination with the NHDES Hazardous Waste Remediation Bureau to ensure that the contaminated soil is properly managed, in accordance with Env-Wt 307.10(l).
7. Fill shall be clean sand, gravel, rock, or other material that meets the project's specifications for its use; and does not contain any material that could contaminate surface or groundwater or otherwise adversely affect the ecosystem in which it is used, in accordance with Env-Wt 307.11(a).
8. All work, including management of soil stockpiles, shall be conducted so as to minimize erosion, minimize sediment transfer to surface waters or wetlands, and minimize turbidity in surface waters and wetlands, in accordance with Env-Wt 307.03(b).

[www.des.nh.gov](http://www.des.nh.gov)

29 Hazen Drive • PO Box 95 • Concord, NH 03302-0095  
NHDES Main Line: (603) 271-3503 • Subsurface Fax: (603) 271-6683 • Wetlands Fax: (603) 271-6588  
TDD Access: Relay NH 1 (800) 735-2964

9. Water quality control measures shall be selected and implemented based on the size and nature of the project and the physical characteristics of the site, including slope, soil type, vegetative cover, and proximity to jurisdictional areas, in accordance with Env-Wt 307.03(c)(1).
10. Water quality control measures shall be maintained so as to ensure continued effectiveness in minimizing erosion and retaining sediment on-site during and after construction, in accordance with Env-Wt 307.03(c)(5).
11. Temporary water quality control methods shall be removed upon completion of work when compliance with Env-Wt 307.03(c)(6) is achieved, in accordance with Env-Wt 307.03(c)(7).
12. The person in charge of construction equipment shall inspect such equipment for leaking fuel, oil, and hydraulic fluid each day prior to entering surface waters or wetlands or operating in an area where such fluids could reach groundwater, surface waters, or wetlands, in accordance with Env-Wt 307.03(g)(1).
13. Equipment shall be staged and refueled outside of jurisdictional areas (unless allowed) and in accordance with Env-Wt 307.15, per Env-Wt 307.03(h).

**THIS PERMIT IS SUBJECT TO THE FOLLOWING GENERAL CONDITIONS:**

1. Pursuant to RSA 482-A:12, a copy of this permit shall be posted in a secure manner at the site of the project.
2. In accordance with Env-Wt 313.01(a)(5), and as required by RSA 482-A:11, II, work shall not infringe on the property rights or unreasonably affect the value or enjoyment of property of abutting owners.
3. In accordance with Env-Wt 314.01, a standard permit shall be signed by the permittee, and the principal contractor who will build or install the project prior to start of construction, and will not be valid until signed.
4. In accordance with Env-Wt 314.08(a), the permittee shall file a notice of completion of work and certificate of compliance with the department within 10 working days of completing the work authorized by this permit.
5. In accordance with Env-Wt 314.06, transfer of this permit to a new owner shall require notification to the NHDES.
6. The permit holder shall ensure that work is done in a way that protects water quality per Env-Wt 307.03; protects fisheries and breeding areas per Env-Wt 307.04; protects against invasive species per Env-Wt 307.05; meets dredging activity conditions in Env-Wt 307.10; and meets filling activity conditions in Env-Wt 307.11.
7. This project has been screened for potential impact to known occurrences of protected species and exemplary natural communities in the immediate area. Since many areas have never been surveyed, or only cursory surveys have been performed, unidentified sensitive species or communities may be present. This permit does not absolve the permittee from due diligence in regard to state, local or federal laws regarding such communities or species. This permit does not authorize in any way the take of threatened or endangered species, as defined by RSA 212-A:2, or of any protected species or exemplary natural communities, as defined in RSA 217-A:3.
8. In accordance with Env-Wt 307.06(a) through (c), no activity shall jeopardize the continued existence of a threatened or endangered species, a species proposed for listing as threatened or endangered, or a designated or proposed critical habitat under the Federal Endangered Species Act, 16 U.S.C. §1531 et seq.; State Endangered Species Conservation Act, RSA 212-A; or New Hampshire Native Plant Protection Act, RSA 217-A.
9. In accordance with Env-Wt 307.02 and federal requirements, all work in areas under the jurisdiction of the U.S. Army Corps of Engineers (USACE) shall comply with all conditions of the applicable state general permit.

APPROVED:

Stefanie M. Tetreault  
Inland Wetland Supervisor, Wetlands Bureau  
Land Resources Management, Water Division

**Re: Approved Standard Dredge and Fill Wetlands Permit Application (RSA 482-A)**  
**NHDES File Number: 2021-00240**  
**Subject Property: 375 Banfield Rd, Portsmouth, Tax Map #266, Lot #7**

Dear Applicant:

On December 06, 2021, the New Hampshire Department of Environmental Services (NHDES) Wetlands Bureau approved the above-referenced Standard Dredge and Fill Wetlands Permit Application. Enclosed please find Wetlands Permit # 2021-00240 to dredge and fill 1,910 square feet of palustrine scrub-shrub wetland for commercial lot development.

**This approval is based on the following findings:**

1. This is classified as a minimum impact project per Rule Env-Wt 524.06(a).
2. The commercial development project meets the all of the approval criteria established in Env-Wt 524.02.
3. Per Rule Env-Wt 313.01(a)(4), all project-specific and resource-specific criteria established in Env-Wt 500 have been met.
4. Per Rule Env-Wt 306.05, the applicant has addressed all of the required planning items that are used to determine the appropriate impact classification of a project and the type of approval required.
5. Per Rule Env-Wt 202.01(b) and as required by RSA 482-A:8, NHDES finds that the requirements for a public hearing do not apply as the project will not have a significant environmental impact, as defined in Env-Wt 104.19, on the resources protected by RSA 482-A, or, is not of substantial public interest, as defined in Env-Wt 104.32.
6. Per Rule Env-Wt 313.01(a)(5), and as required by RSA 482-A:11, II, this permit for work to dredge or fill will not "infringe on the property rights or unreasonably affect the value or enjoyment of property of abutting owners" based on documentation that the proposed dredge and fill activity will be located entirely within the boundary of the applicant's property interest and will not result in any observable change in off-site surface water levels or flows.
7. Per Rule Env-Wt 313.03(a), the applicant has demonstrated that potential impacts to jurisdictional areas have been avoided to the maximum extent practicable and that any unavoidable impacts have been minimized.
8. Per Rule Env-Wt 311.06(h), the municipal conservation commission recommend conditional approval of the NHDES Wetlands Permit application in correspondence dated June 24, 2021.
9. Per Rule Env-Wt 311.01(b), the applicant coordinated with the Natural Heritage Bureau (NHB) to determine how to avoid and minimize project-related impacts on protected plants or exemplary natural communities.
10. This project received conditional approval from the NHDES Alteration of Terrain Bureau on October 28, 2021 (AoT-2040) and is also subject to review and additional coordination with the NHDES Hazardous Waste Remediation Bureau (Project #40176).

11. Per Rule Env-Wt 311.06(j), as of the date of this permit, the applicant has not received comments from any federal agency.
12. Per Rule Env-Wt 311.03(b)(7), the applicant has provided an explanation as to methods, timing, and manner as to how the project will meet standard permit conditions specified in Env-Wt 307.

In accordance with RSA 482-A:10, RSA 21-O:14, and Rules Env-WtC 100-200, **any person aggrieved by this decision may file a Notice of Appeal directly with the NH Wetlands Council (Council) within 30 days of the decision date, December 06, 2021.** Every ground claiming the decision is unlawful or unreasonable must be fully set forth in the Notice of Appeal. Only the grounds set forth in the Notice of Appeal are considered by the Council. Information about the Council, including Council Rules, is available at <https://nhec.nh.gov/wetlands/index.htm>. For appeal related issues, contact the Council Appeals Clerk at (603) 271-6072.

If you have any questions, please contact me at [Stefanie.M.Tetreault@des.nh.gov](mailto:Stefanie.M.Tetreault@des.nh.gov) or (603) 271-0676.

Sincerely,

Subject: Proposed Industrial Warehouse Building - Response to Comments  
Portsmouth, New Hampshire

Date: May 17, 2021

---

On December 28, 2020 our office published a “trip generation analysis” memorandum for the proposed industrial warehouse building that will be constructed at 375 Banfield Road in Portsmouth, New Hampshire. We are now in receipt of two City comments from a recent TAC meeting that we were asked to respond. We offer the following responses:

TAC Comment 2: *“The stopping sight distance is met at the proposed driveway location, which means that a vehicle traveling on Banfield Road will have enough time and distance to be able to come to a complete stop without colliding with a truck exiting the site. However, this is not a desirable condition, having to require vehicles to come to a complete stop to allow for entering trucks. It would be preferable if the intersection sight distance could also be provided, which is over 675 feet. Intersection sight distance provides enough time and distance for approaching vehicles to slow to 70 percent of their travel speed when a truck is exiting the driveway.”*

**SGP Response:** Sheet H1 indicates that there is over 500+ feet of Intersection Sight Distance (ISD) available for the left-turn departure movement from the proposed site driveway. This exceeds the calculated distance required of 441.0-feet for passenger cars. This sheet also indicates that there is at least 347-feet of ISD for the right-turn departure movement (limited by extent of field survey), and that additional sight distance is available beyond the survey limit. This compares well with the calculated distance of 382.2-feet for passenger cars.

Providing sufficient stopping sight distance is essential for safety reasons; whereas the need for a major-road vehicle to slow to accommodate the occasional departure by a minor-road vehicle is an “everyday” occurrence at most intersections that is more related to driver convenience than safety. For this reason, providing ISD it is considered preferable, but not essential. Given the available sight distances at the proposed driveway, we do not expect that any vehicles on Banfield Road will need to come to a complete stop on a regular basis due to the proposed site driveway.

TAC Comment 6: *“Adding 50 truck trips a day will approximately double the amount of truck traffic currently on Banfield Rd. The current plans for the scheduled reconstruction of the roadway by the City will need to be modified at the expense of the applicant in order to accommodate this extra truck traffic. Wider shoulders, the road bed and the pavement thickness will all have to be engineered. The applicant will need to hire a third-party engineer of the City’s choosing to start the design process. The applicant will be responsible for any changes necessary in the reconstruction of the road that are over and above what the City had already planned including permitting for wider shoulders if necessary.”*

**SGP Response:** This is not correct for two reasons. First, the 50-truck estimate appears to come from Table 1B in our December memorandum. That volume represents the higher of the two truck estimates given (for warehousing; not manufacturing), and it pertains to the daily number of trucks using the site driveway. It is reasonable to expect that these trucks will travel to/from both points east and west on Banfield Road. If the truck trips were distributed equally by direction, then the net increase on Banfield Road would be +25 truck trips per day. It should also be noted that the previous businesses at this industrial site likely generated truck trips as well. This means that the net impact on truck trips on Banfield Road due to the proposed building is less than is indicated in Table 1B in our December memorandum.

Second, the City seems to infer that Banfield Road currently carries only 50 trucks per day (i.e., doubling of the truck volume). The basis for that estimate has not been provided. For illustration purposes, our office previously conducted traffic counts on Banfield Road at the Saint Patrick Academy driveway on two separate weekdays in November 2019. During the six-hour count period (7-9 AM, 2-6 PM), 38 trucks (Wednesday 6 hours) and 42 trucks (Thursday 6 hours) traveled on Banfield Road, east of the Academy. Another recent traffic count conducted by our office on Peverly Hill Road (south of NH33) in September 2020 revealed that approximately 45% of the daily truck volume occurred during those six specific hours. From this it is reasonable to conclude that Banfield Road carries approximately 90 trucks per day, and that truck traffic from the subject site increases that by +25 trucks per day (using no allowance for previous businesses on the site). Under post-development conditions, trucks from the subject site will account for approximately 22% of the total truck volume ( $25/[90+25]$ ) on Banfield Road.

DES Site #199408047, Project #40176

*Supplemental Site Investigation Report*, prepared by Wilcox & Barton, Inc. (Wilcox & Barton), dated November 22, 2021

Dear Robert Graham:

The New Hampshire Department of Environmental Services (NHDES) has reviewed the subject Supplemental Site Investigation (SSI) Report submitted on your behalf by Wilcox & Barton for the above-referenced site (Site). The SSI was completed to further investigate the nature and extent of various contaminants in soil, groundwater, surface water, and sediment at the Site. The investigation activities were conducted in general accordance with the plans for investigation outlined in the *Response to NHDES Comments* document submitted by Wilcox & Barton on September 8, 2021 and subsequent email correspondences, and to satisfy, in part, requests made by NHDES in a letter dated August 9, 2021. Based on review of the SSI Report and historical submittals, NHDES offers the following comments:

**Upland Soil Contamination**

NHDES understands the northeastern, upland portion of the Site is planned for redevelopment as a commercial warehouse. Based on the results of previous investigations, soil in this area of the Site is contaminated with lead and polychlorinated biphenyls (PCBs) at concentrations exceeding applicable Soil Remediation Standards (SRS). The lead and PCBs appear to be from releases associated with former Site activities, including automobile storage, crushing and salvage operations. As part of the SSI activities completed during September and October 2021, Wilcox & Barton collected shallow soil samples generally on a grid layout. Samples collected for analysis of lead were taken from 0-2 feet and 2-4 feet below ground surface (bgs). Samples collected for analysis of PCBs were taken from 3-6 inches, 6-18 inches, and 18-36 inches bgs. The results of the sampling and analysis have improved the understanding of the nature and extent of lead and PCB soil contamination. For the upland area, soils contaminated with lead and PCBs at concentrations exceeding applicable SRS appear to be mostly in the location of a former car crusher and an area to the southeast of the former car crusher. The vertical extent of lead and PCB soil contamination has not yet been fully delineated, and NHDES understands from communications with Wilcox & Barton that additional soil sampling to depths as great as 15 feet bgs will be completed to inform management of contaminated soil and construction activities during Site redevelopment.

Based on previous communications, including a conference call held April 11, 2022, NHDES understands that Wilcox & Barton intends to submit prior to initiation of Site redevelopment activities a soil management plan (SMP) and a Remedial Action Plan (RAP) for soil contaminated with lead and PCBs in

the upland portion of the Site. The SMP shall describe the management of soil during Site redevelopment activities, to include excavations, any temporary onsite storage, reuse, and any offsite disposal of soil conducted in accordance with NH Code of Administrative Rules Chapter Env-Or 600 (*Contaminated Site Management*), Part Env-Or 611. Wilcox & Barton has indicated the RAP will include a remedy consisting of managing the contaminated soil under placement of suitable capping materials and recordation of an Activity and Use Restriction (AUR). NHDES generally concurs with this approach and notes the following: 1) Wilcox & Barton will continue to communicate with the US EPA Region 1 PCB coordinator regarding the soil analytical data for PCBs, the results of the *Human Health Risk Assessment – PCBs* that is attached to the SSI Report, and management of PCB-containing soils; 2) Soils containing PCBs at concentrations greater than 10 milligrams per kilogram (mg/kg) may warrant excavation and offsite disposal; and 3) The application for AUR shall include a requirement to prepare a separate SMP for management of any soil that may be disturbed during future Site activities.

Please submit the RAP for the upland portion of the Site, with the SMP and application for AUR included, within 120 days of receipt of this letter. Please also indicate in the RAP that, as discussed in the following sections of this letter, Site groundwater contaminated with per- and polyfluoroalkyl substances (PFAS) and metals will be managed under a Groundwater Management Permit (GMP), the application for which shall be submitted following completion of additional monitoring activities and no later than December 31, 2022.

### **Upland Groundwater Contamination**

The results of sampling Site monitoring wells since June 2020 for analysis of PFAS shows that these contaminants are present in groundwater beneath the upland portion of the Site. Concentrations of perfluorooctane sulfonic acid (PFOS), perfluorohexane sulfonic acid (PFHxS), and perfluorooctanoic acid (PFOA) have been detected in samples collected from various wells at concentrations exceeding applicable Ambient Groundwater Quality Standards (AGQS). To date, the highest concentrations of PFAS have been detected in samples collected from wells MW-1, MW-7, MW-106R, MW-109, and MW-203. The source of PFAS in upland Site groundwater has not been specifically documented. NHDES suspects that former Site operations, such as automobile maintenance, salvage, and crushing as well as wastewater disposal to a septic system and leachfields may have resulted in releases of PFAS to soil and groundwater. Notably, samples collected from wells MW-101, MW-102, MW-103, MW-104, and MW-105 located hydraulically downgradient of the upland area have contained relatively low concentrations of PFAS, including PFOS, PFHxS and PFOA at concentrations less than applicable AGQS. However, only one or two rounds of sampling have been completed at these downgradient wells.

Additional sampling of groundwater for analysis of PFAS is warranted due to the continued presence of PFOS, PFHxS, and PFOA at concentrations exceeding applicable AGQS. As such, NHDES requests that two additional rounds of groundwater sampling for analysis of PFAS be completed during the year 2022, preferably during the spring and fall. Please include the following monitoring wells in the sampling program: MW-1, MW-4, MW-6, MW-7, MW-8, MW-102, MW-104, MW-105, MW-106R, MW-109, MW-203, and MW-11. Sampling of wells MW-102, MW-104, and MW-105 shall provide data to evaluate the downgradient extent of PFAS in Site groundwater. Sampling of well MW-11 shall provide data regarding upgradient, ambient groundwater quality. Sampling of the other wells is requested due to previous exceedances of applicable AGQS. Please also collect static water level measurements at all Site wells for the preparation of groundwater elevation contour figures. The results of the spring and fall 2022

groundwater monitoring activities shall be submitted by December 31, 2022 as part of the Application for GMP prepared in accordance with Env-Or 607. For the site plans required as part of the Application for GMP, please include the location of all potential sources of contaminants, such as automobile maintenance, salvage and crushing, the septic system and leachfields, and the approximate extent of waste disposal at the Site.

Please continue to analyze samples for a broad list of PFAS in accordance with NHDES' current guidelines (see Laboratory Testing Guidelines for PFAS and Waste Sites: [Microsoft Word – pfoa-testing-labs\\_rev\\_mar\\_19\\_waste\\_sites\\_only\\_\(state.nh.us\)](#)). Please also continue to upload PFAS analytical data to the NHDES Environmental Monitoring Database.

### **Lowland Soil Contamination and Solid Waste**

Based on the results of previous investigations and review of existing Site documents, NHDES understands the lowland portion of the Site is the location of historical solid waste disposal that was previously registered with NHDES as a landfill not operated after July 9, 1981 ("Pre-1981 Landfill"; see attached registration form and associated documentation). The landfill reportedly contains construction and demolition debris resulting from urban redevelopment activities in the City of Portsmouth. During visits to the Site, Wilcox & Barton and NHDES staff also observed automobile parts and other debris in the lowland area that are likely associated with former use of the Site as an automobile salvage facility.

As part of the SSI activities, Wilcox & Barton collected shallow soil samples generally on a grid layout in the lowland portion of the Site. Samples collected for analysis of lead were taken from 0-2 feet and 2-4 feet bgs. The majority of samples contained lead at concentrations exceeding the SRS, with some detections greater than 10,000 mg/kg. Samples collected for analysis of PCBs were taken from 3-6 inches and 6-18 inches bgs. Five samples (B-11, W-13, X-10, X-14, Y-9) collected from the 3-6 inch depth interval and two samples (B-11 and X-14) collected from the 6-18 inch depth interval contained PCBs (total of all Aroclors) at concentrations greater than the SRS. Additionally, previous investigations identified asbestos in bulk waste samples and suspect asbestos-containing material in the lowland area of the Site. It appears the lead, PCBs, and asbestos in the lowland portion of the Site are associated with the Pre-1981 Landfill and perhaps disposal of waste related to former automobile salvage operations.

NHDES has concluded that additional delineation of the waste in the Pre-1981 Landfill and any waste associated with the former automobile salvage operations at the Site is warranted. Please see the below section of this letter regarding submittal of a work plan for additional investigation activities.

### **Lowland Groundwater Contamination**

The results of sampling monitoring wells MW-101, MW-102, MW-103, and MW-104 since January 2021 for analysis of total and dissolved metals shows that lead and arsenic are present in groundwater beneath the lowland portion of the Site at concentrations exceeding applicable AGQS. These wells are located within and downgradient of the Pre-1981 Landfill and areas of waste disposal related to former automobile salvage operations. While the arsenic in groundwater may be due to naturally occurring conditions, NHDES concludes the lead at concentrations exceeding the AGQS is likely associated with the presence of high concentrations of lead in the lowland soil and solid waste.

Additional sampling of lowland groundwater for analysis of total and dissolved metals is warranted due to: 1) The continued presence of lead and arsenic in the groundwater at concentrations exceeding the AGQS; 2) The lowland soil and solid waste containing lead at concentrations exceeding the SRS currently remaining in place and representing a source of metals leaching to groundwater; and 3) The potential for groundwater discharging to the abutting wetland to be a contaminant migration pathway for metals from the lowland source area to wetland surface water and sediment. As such, NHDES requests that two additional rounds of groundwater sampling at wells MW-101, MW-102, MW-103, and MW-104 be completed during the year 2022, preferably during the spring and fall. Sampling of well MW-103 may provide data regarding groundwater conditions upgradient of the Pre-1981 Landfill. Please also continue to collect field-based water quality parameters (e.g., temperature, dissolved oxygen, pH, conductivity, oxidation-reduction potential, and turbidity) during the sampling of these wells. The results of the spring and fall 2022 lowland groundwater monitoring activities shall be submitted by December 31, 2022 as part of the Application for GMP discussed above.

### **Wetland Surface Water and Sediment Contamination**

NHDES understands that a wetland abuts the lowland portion of the Site to the southeast, south, and southwest. A branch of Pickering Brook runs through the wetland, flowing downstream beyond the Site boundary through a culvert located under Banfield Road and to Great Bog. Field observations indicate the upstream portion of the brook may contain surface water only seasonally. As part of SSI activities, Wilcox & Barton collected six onsite surface water samples (SW-201, SW-203, SW-208, SW-210, SW-211, and SW-212) in the wetland and generally along the course of the brook for analysis of total and dissolved metals, polycyclic aromatic hydrocarbons (PAHs), chloride, nitrate, sulfate, hardness, total and suspended solids, and field-based water quality parameters. The sampling expanded upon previous surface water assessment activities completed at the Site, and the results indicate that contamination associated with the Pre-1981 Landfill and perhaps waste related to former automobile salvage operations is impacting wetland surface water quality. The concentrations of various metals, particularly lead, were found to exceed NHDES water quality criteria for protection of aquatic life in a freshwater environment and human health based on potential water and fish ingestion.

Wilcox & Barton also collected 20 sediment samples (SD-201 through SD-221, excluding location SD-216) for analysis of total metals and PAHs. The sampling expanded upon previous sediment assessment activities completed at the Site. The analytical results were compared to Consensus-Based Threshold Effect Concentrations (TECs) and Consensus-Based Probable Effect Concentrations (PECs)<sup>1</sup>, which are referenced in NHDES' *Evaluation of Sediment Quality Guidance Document* dated April 2005. The concentrations of multiple metals, particularly lead, and PAHs exceeded applicable TECs and PECs.

Sovereign Consulting, Inc., using existing Site information and the surface water and sediment data, prepared a *Focused Human Health and Ecological Risk Assessment* for Wilcox & Barton. The risk assessment is included as an attachment to the SSI Report. Sovereign Consulting concluded that: 1) Contamination, primarily that of lead, mercury and arsenic, in the wetland portion of the Site poses an unacceptable risk to human health for recreational trespassers that do and do not catch and consume

---

<sup>1</sup> MacDonald, D. D., C. G. Ingersoll, and T. A. Berger. 2000. Development and evaluation of consensus-based sediment quality guidelines for freshwater ecosystems. *Arch. Environ. Contam. And Toxicol.* 39: 20-31.

fish, and for fish consumption without trespassing; 2) Contamination, primarily that of lead, in surface water poses a potential risk to pelagic aquatic organisms; and 3) Contamination, primarily that of lead, in sediment is likely toxic to benthic organisms residing in the wetlands.

Based on the results of the lowland and wetland portions of the SSI and associated risk assessment, NHDES requests submittal of a work plan for additional investigation activities that includes: 1) Delineation of the extent of the lowland Pre-1981 Landfill waste and any waste associated with former automobile salvage operations, with the results presented on a site plan figure; 2) Delineation of the extent of contamination in Pickering Brook surface water and sediment at concentrations exceeding applicable water quality standards and TECs and PECs upstream and downstream of previously collected samples, including beyond the culvert at Banfield Road; 3) Delineation of the extent of contamination in wetland sediment at concentrations exceeding applicable TECs and PECs to the southeast, south, and southwest of previously collected samples; and 4) In accordance with recommendations made by Sovereign Consulting, completion of a survey, or inventory, of fish and other biota present in the wetland and Pickering Brook. The survey will inform the collection of samples for analysis of tissue for select contaminants, if warranted. NHDES requests submittal of the work plan within 120 days of receipt of this letter. The results of the additional investigation activities shall inform the preparation of a RAP for the lowland portion of the Site, the wetland and Pickering Brook, as appropriate. NHDES expects that completion of additional investigation activities and submittal of the RAP will occur during the years 2022 and 2023. NHDES is amenable to discussions with Wilcox & Barton regarding the work plan during its preparation, including the selection of specific contaminants for laboratory analysis.

As indicated by the timeframe of requests made in this letter, NHDES is agreeable to the remediation and redevelopment of the northeastern, upland portion of the Site while investigation and remediation planning activities continue to proceed for the lowland portion of the Site, the wetland and Pickering Brook. NHDES' rationale includes the following: 1) Soil and groundwater contamination in the lowland portion of the Site, and surface water and sediment contamination in the wetland and Pickering Brook portions of the Site, appear to be primarily associated with the Pre-1981 Landfill and perhaps the dispersive disposal of automobile parts and related wastes, whereas soil contamination in the upland portion of the Site appears to be the result of former automobile crushing and salvage operations conducted at locations separate from the lowland and wetland; 2) A remedy for the upland portion of the Site that includes managing contaminated soil under placement of suitable capping materials and an AUR will help prevent transport of contaminated surface soil via stormwater runoff to the wetland, which may have been a minor source of contamination to the wetland and Pickering Brook historically and could continue to occur without the placement of capping materials; and 3) Based on review of Alteration of Terrain Application 210601-079 and subsequent issuance of Alteration of Terrain Permit AoT-2040, NHDES understands the stormwater management features to be constructed during Site redevelopment will result in a controlled, lower rate of stormwater discharge to the wetland compared to what occurs currently, and that disturbance and mobilization downstream of contaminated wetland sediment is unlikely to occur with the expected lower rates of stormwater discharge.

NHDES notes it is imperative that best management practices for stormwater are followed during construction activities conducted as part of Site redevelopment to prevent transport of disturbed and exposed contaminated soils to the wetland and Pickering Brook.

# REGISTRATION FORM FOR LANDFILLS NOT OPERATED AFTER JULY 9, 1981

pursuant to Part Env-Sw 309 of the New Hampshire Solid Waste Rules

### INSTRUCTIONS

- (1) Complete this form by providing all requested information. If you need more space than provided on the form to answer a particular question, attach additional pages as necessary and mark each page clearly to indicate the section and question number being answered.
- (2) Submit **TWO** copies of the completed form, **EACH** bearing an **ORIGINAL** signature, to the following address:  
  

New Hampshire Department of Environmental Services (DES)  
 Waste Management Division  
 Permitting & Design Review Section (P&DRS)  
 29 Hazen Drive, PO Box 95  
 Concord, NH 03302-0095
- (3) All references on this form beginning with "Env-Sw" are citations from the New Hampshire Solid Waste Rules. You may obtain a copy of the Rules from the DES Public Information and Permitting Office at (603) 271-2975 or TDD Access: Relay NH 1-800-735-2964. The Rules are also available on the Internet at <http://www.des.nh.gov>.
- (4) Your registration will be processed according to Env-Sw 309.04. You will be notified in writing whether the registration is complete and accepted. If complete and accepted, the registered facility shall be deemed exempt from the Rules. However, other action to assure proper closure may be required at the facility pursuant to other provisions of law.
- (5) For further assistance with completing this form, contact the DES P&DRS at (603) 271-2925, or at the above-noted mailing address or TDD Access: Relay NH 1-800-735-2964.

### SECTION I. FACILITY IDENTIFICATION

(1)	Facility name: <u>NONE</u>
(2)	Location by street address and municipality: <u>375 BANFIELD RD PORTSMOUTH, NH</u>
(3)	Facility mailing address: <u>26 CONSTITUTION WAY DOVER, NH 038</u>
(4)	Local tax map and lot numbers: <u>Map 216, LOT 7</u>
(5)	Deed reference by county, volume and page numbers: <u>Rockingham, BK 3555, Pg 0083</u>
(6)	Latitude and longitude of a known fixed point on the site: <u>N43° 02' 48" W to 47. 025'</u>
(7)	Plot the location of the facility on a United States Geological Survey (USGS) topographic map, or copy thereof, prepared at a scale of 1:24,000 or 1:25,000. Attach and mark as "Attachment I(7)."
(8)	Provide written directions from a known point of reference in the vicinity of the facility site: <u>Rt 1 LaFayette Rd, Right onto BEVERLY Hill Rd, Right onto BANFIELD RD</u>

### SECTION II. FACILITY OWNER IDENTIFICATION c/o William Copeland, executor of Trust

(1)	Owner name: <u>ESTATE OF VIRGINIA COPELAND (owner deceased)</u>		
(2)	Owner mailing address: <u>26 CONSTITUTION WAY DOVER, NH 03820</u>		
(3)	Owner telephone number: <u>(603) - 749-9719</u>		
(4)	If different than above, identify the individual associated with and designated by the facility owner to be the contact individual for matters concerning this facility:		
	(a) Name:	(b) Title:	
	(c) Mailing address:		
	(d) Telephone number:		

(5)	If the facility owner is an individual, provide date of birth and go to Section III: <b>DECEASED</b>
(6)	If the facility owner is a corporation, partnership or other association, provide the following information as specified:
(a)	The facility is owned by a: <input type="checkbox"/> corporation <input type="checkbox"/> partnership <input checked="" type="checkbox"/> other association <b>In TRUST to The</b>
(b)	State of incorporation/formation: <b>NH</b> <b>Four Copeland BROTHERS:</b>
(c)	Principal business address: <b>Jack Copeland, James Copeland, Kevin Copeland &amp; William Copeland</b>
(d)	Provide, on separate paper and attach/mark as "Attachment II(6)(c)," the names and addresses of all directors, officers and shareholders(*), if for a corporation; all partners (whether general or limited), if for a partnership; or all principals, members or participants, if for another type of association.
(*) For a privately held corporation, identify all shareholders. For a publicly traded corporation, identify all shareholders owning 10% or more of the corporation's equity or debt.	

### SECTION III. FACILITY OPERATOR IDENTIFICATION

(1)	Is the facility owner also the facility operator? <input type="checkbox"/> NO <input checked="" type="checkbox"/> YES (if yes, skip questions (2) - (7) and go to Section IV)
(2)	Operator name: <b>WILLIAM COPELAND, EXECUTOR OF THE TRUST</b>
(3)	Operator mailing address: <b>26 CONSTITUTION WAY DOVER, NH 03820</b>
(4)	Operator telephone number:
(5)	If different than above, identify the individual associated with and designated by the facility operator to be the contact individual for matters concerning this facility:
(a)	Name:
(b)	Title:
(c)	Mailing address:
(d)	Telephone number:
(6)	If the operator is an individual, provide date of birth and go to Section IV: <b>7-25-40 (EXECUTOR William Copeland)</b>
(7)	If the facility operator is a corporation, partnership or other association, provide the following information as specified:
(a)	The facility is operated by a: <input type="checkbox"/> corporation <input type="checkbox"/> partnership <input checked="" type="checkbox"/> other association ( <b>TRUST</b> )
(b)	State of incorporation/formation: <b>NH</b>
(c)	Principal business address: <b>26 CONSTITUTION WAY DOVER NH 03820</b>
(d)	Provide, on separate paper and attach/mark as "Attachment III(7)(c)," the names and addresses of all directors, officers and shareholders(*), if for a corporation; all partners (whether general or limited), if for a partnership; or all principals, members or participants, if for another type of association.
(*) For a privately held corporation, identify all shareholders. For a publicly traded corporation, identify all shareholders owning 10% or more of the corporation's equity or debt.	

### SECTION IV. PROPERTY OWNER IDENTIFICATION

(1)	Is the facility owner, as identified in Section II of this form, also the owner of the property on which the facility is situated? <input type="checkbox"/> NO <input checked="" type="checkbox"/> YES (if yes, skip questions (2) - (7) and go to Section VI)
(2)	Property owner name: <b>TRUST OF VIRGINIA COPELAND</b>
(3)	Property owner mailing address: <b>90 William Copeland 26 CONSTITUTION WAY DOVER, NH 03820</b>
(4)	Property owner telephone number: <b>603-749-9719</b>
(5)	If different than above, identify the individual associated with and designated by the property owner to be the contact individual for matters concerning this facility:
(a)	Name:
(b)	Title:
(c)	Mailing address:
(d)	Telephone number:
(6)	If the property owner is an individual, provide date of birth and go to Section V: <b>IN TRUST</b>
(7)	If the property owner is a corporation, partnership or other association, provide the following information as specified:
(a)	The property is owned by a: <input type="checkbox"/> corporation <input type="checkbox"/> partnership <input type="checkbox"/> other association
(b)	State of incorporation/formation:
(c)	Principal business address:
(d)	Provide, on separate paper and attach/mark as "Attachment IV(7)(d)," the names and addresses of all directors, officers and shareholders(*), if for a corporation; all partners (whether general or limited), if for a partnership; or all principals, members or participants, if for another type of association.
(*) For a privately held corporation, identify all shareholders. For a publicly traded corporation, identify all shareholders owning 10% or more of the corporation's equity or debt.	

### SECTION V. OTHER PERMITS

(1)	Has the New Hampshire Department of Environmental Services issued any written permits for the facility or site? <input type="checkbox"/> YES <input checked="" type="checkbox"/> NO (if NO, skip question (2) and go to Section VI)																
(2)	Provide the following information for each permit so issued:																
	<table border="1"> <thead> <tr> <th>Type of Permit/Approval</th> <th>Date Issued</th> <th>Permit Number</th> <th>Status/Comments</th> </tr> </thead> <tbody> <tr> <td> </td> <td> </td> <td> </td> <td> </td> </tr> <tr> <td> </td> <td> </td> <td> </td> <td> </td> </tr> <tr> <td> </td> <td> </td> <td> </td> <td> </td> </tr> </tbody> </table>	Type of Permit/Approval	Date Issued	Permit Number	Status/Comments												
Type of Permit/Approval	Date Issued	Permit Number	Status/Comments														

## SECTION VI. STATUS OF FACILITY OPERATIONS

(1)	Date facility commenced operations (i.e., date facility began receiving waste):	1970 <sup>s</sup> A one time event
(2)	Date facility ceased operations (i.e., date of last waste receipt):	Approximately a 6-8 week operation

## SECTION VII. TYPE OF OPERATIONS

Identify the type(s) of waste management activities that were conducted at the facility:

<input type="checkbox"/>	Collection	<input type="checkbox"/>	Storage	<input type="checkbox"/>	Transfer
<input type="checkbox"/>	Processing	<input type="checkbox"/>	Treatment	<input checked="" type="checkbox"/>	Landfilling: <input type="checkbox"/> open burning <input type="checkbox"/> lined <input checked="" type="checkbox"/> unlined

\* ONE TIME operation - only took in bldg. materials during

## SECTION VIII. TYPE OF SERVICE Portsmouth urban re-development from City of Portsmouth, only

(1)	Did this facility operate commercially? <input type="checkbox"/> YES <input checked="" type="checkbox"/> NO not as a landfill
(2)	Did this facility receive waste ONLY from sources within the control/jurisdiction of the facility owner? <input checked="" type="checkbox"/> YES <input type="checkbox"/> NO

## SECTION IX. SERVICE AREA

Identify the geographic region served by this facility. If the facility received waste from any source, so state and identify area most commonly served.

City of Portsmouth - urban re-development	
---	--

## SECTION X. TYPE OF WASTE HANDLED BY FACILITY

Identify the type(s) of waste received by the facility:

<input checked="" type="checkbox"/>	Asbestos <small>IN some bldg materials</small>	<input type="checkbox"/>	Putrescible waste	<input checked="" type="checkbox"/>	Construction & demolition debris	<input type="checkbox"/>	Mixed municipal solid waste
<input type="checkbox"/>	Ash-household	<input type="checkbox"/>	Bulky waste (furniture, stumps, etc.)	<input type="checkbox"/>	Infectious waste	<input type="checkbox"/>	Tires
<input type="checkbox"/>	Ash-municipal solid waste	<input type="checkbox"/>	Recyclable materials	<input type="checkbox"/>	White goods (appliances, etc.)	<input type="checkbox"/>	Yard waste
<input type="checkbox"/>	Household hazardous waste	<input type="checkbox"/>	Contaminated soils	<input type="checkbox"/>	Hazardous waste	<input type="checkbox"/>	Sludge/septage
<input checked="" type="checkbox"/>	Other (specify): AUTO PARTS						

## SECTION XI. FACILITY CAPACITY & COVER

(1)	Estimated volume (cubic yards) of waste landfilled at the facility:	estimated less than 1 acre of 15A lot
(2)	Estimated maximum depth/height of waste (feet):	have not excavated more than 6'
(3)	Describe type of cover material placed over landfilled waste (e.g., sand, gravel, clay, till, loam; vegetated or non-vegetated; estimated depth of each, etc.):	Sand, gravel with wild vegetation growth. 2-6' cover
(4)	Estimated maximum depth of cover material:	0-6 FEET
(5)	Estimated minimum depth of cover material:	0-1 FT.
(6)	Estimated maximum slope:	3%
(7)	Estimated minimum slope:	Flat 0%
(8)	Are gas vents installed? <input type="checkbox"/> YES (how many?) <input checked="" type="checkbox"/> NO	

## SECTION XII. ENVIRONMENTAL ASSESSMENT REPORTS

(1)	Have any environmental assessments been prepared for the facility or site? <input checked="" type="checkbox"/> YES <input type="checkbox"/> NO
(2)	If YES, attach a copy of each report, including groundwater-monitoring data if available. <u>yes</u>

Re: 375 Banfield Rd.  
Portsmouth, NH

Dear Mr. Kemp:

Enclosed please find the second draft of the Registration form for Landfills not operated after 7/6/81. As you requested I have filled out the information known at this time. Once you have agreed that the information provided is sufficient I will have the Executor of the Trust/Estate sign the form and re-submit it with all the reports prepared for the site as well.

If you have any questions, or comments regarding this form, please contact me via cell phone: 603-867-8908 as I will be out of State until June 1, 2000. Thank you for taking the time to review this.

Cordially,

Diane K. Cartier, Project Coordinator

Mr. Michael Guilfooy  
NHDES – Waste Mgmt. Div.  
PO Box 95  
Concord, NH 03301-0095

Re: 375 Banfield Rd. Portsmouth, NH  
NHDES #199408047

Dear Mr. Guilfooy:

As per our recent phone conversation, LCA is making this notification to the NHDES regarding the above referenced site as a Pre-1981 Landfill outlined in Env-SW2100. During a recent site investigation for real estate purposes some evidence of asbestos containing materials (ACM's) were noted in the solid waste building materials that were previously reported on the property to NHDES in a report of 2004 and an additional site investigation in 2006. During the period of urban renewal in the City of Portsmouth (1950's – 1960's) building materials were disposed at the site. The current trustee states that there has been no disposal at the site since that time period. The main area of disposal was the low lying area southeast of the property. This area has since been designated as a non-develop zone due to a wetland buffer requirement. It has been determined that when the site is developed, the buffer zone will be capped either with loam and grass or pavement.

The 2008 report states that ACM's were noted in 3 of 17 bulk building material samples found at the site. The analytical data for the 17 analysis could not be located in the report. The analytical report indicates no asbestos in the soil samples collected at the site.

As required by NHDES, the property owner/operator will follow Env-SW 2104.08 with regards to disclosure and record keeping. Attached please find a copy of the sampling locator plan indicating where the soil samples were taken, a copy of the asbestos soil analysis and a site plan indicating the no-develop zone.

*"Promoting Environmental Responsibility"*

**NOTICE TO RECIPIENTS OF  
MINIMUM IMPACT NH WETLANDS PERMITS**

Your permit was approved by the New Hampshire Wetlands Bureau as a minimum impact project, and your project is automatically approved under the Army Corp’s New Hampshire Programmatic General Permit.

For the purpose of the NH PGP, Minimum Impact Projects do not include new construction of:

- Dams;
- Dikes;
- Water withdrawal of diversion projects which require fill in wetlands or surface waters;
- Wetlands restoration projects, or any projects which involve work in other than low flow conditions (July 1 – September 30);
- Any projects involving more than 3,000 square feet of a water body or wetland fill and secondary impacts.

Also, not included under Minimum Impact Projects are those projects that include the reconstruction or replacement of currently unserviceable structures/fills. The projects must be reviewed through the screening procedures of minor impact projects. The activities in section 10 waters not regulated by the Wetlands Bureau formerly authorized under the Nationwide Permit Program and listed in Appendix A of this document are designated non-reporting activities.

These approvals do not relieve you from obtaining any necessary local permits that may be required by your town.

If you have any questions, feel free to give us a call at 603-271-2147.

\*\*\*\*\*

This notice was sent with minimum impact permit.

## 1.0 INTRODUCTION

Wilcox & Barton, Inc. was retained by Banfield Realty, LLC to perform a Supplemental Site Investigation (SI) for the Former Country Motor Sales at 375 Banfield Road in Portsmouth, New Hampshire (the site or property). The site location is presented on Figure 1 – *Site Location Map* and general site features are presented on Figure 2 – *Proposed Development Plan*.

This report was prepared following completion of a Site Investigation in 2020 pursuant to New Hampshire Department of Environmental Services (NHDES) correspondence with the prior property owner. On August 9, 2021, NHDES responded to the findings of the 2020 *Site Investigation Report* and a *Supplemental Data Transmittal* and requested:

- Preparation and submittal of a *Soil Management Plan*, subject to NHDES review and approval, to describe proper management of soil during redevelopment activities;
- Submittal of an *Application for Activity and Use Restriction*;
- Consideration of options for proper management of polychlorinated biphenyl (PCB)-containing soils, including evaluation of the applicability of the Toxic Substances Control Act regulation and, potentially, coordination with US Environmental Protection Agency (EPA) Region 1;
- Consideration of options for management of Asbestos Containing Materials;
- Preparation and submittal of a *Remedial Action Plan* in accordance with Env-Or 606.10 and Env-Or 606.12;
- Additional sampling of wells MW-101, MW-102, and MW-104 for analysis of total and dissolved metals as wells as field water quality parameters;
- Repeat sampling of well MW-101 for analysis for polycyclic aromatic hydrocarbons (PAHs);
- Additional sampling of wells MW-1, MW-4, MW-5, MW-6, MW-7, MW-8, MW-106R, MW-109, MW-204, and MW-204 for analysis for per- and polyfluoroalkyl substances (PFAS);
- Additional information concerning the nature of wetland sediments and the potential for direct-contact exposure to humans;
- Collection of additional surface water samples, with analysis for metals and hardness and comparison to criteria protective of aquatic life in freshwater as well as criteria protective of human health;
- Clarification of the wetland boundary and the relative locations of sediment and surface water samples.

On September 8, 2021, Wilcox & Barton, Inc. provided a *Response to NHDES Comments* concerning the status of the above requests and a plan to obtain the requested information. A copy of the response is provided in Appendix A. Subsequently, NHDES requested via email dated September 10, 2021, that surface water samples also be analyzed for field-based water quality parameters plus iron, manganese, ammonia, chloride, nitrate, sulfate, and total suspended and dissolved solids.

This report is submitted in partial fulfillment of these requests. The new data have added substantially to the understanding of environmental conditions at the project site.

## **2.0 GENERAL SITE INFORMATION**

### **2.1 Property Description**

The site is a 17.32-acre lot in an industrial and residential area of Portsmouth and identified by the City of Portsmouth Tax Assessor's records as Map 266, Lot 7. Topography across the property decreases in elevation from the northeast to the southwest. The site is zoned as industrial and is improved by two one-story commercial automotive maintenance buildings and one two-story garage building used for storage. The remainder of the subject property includes a paved parking lot abutting Banfield Road, landscaped areas, cleared undeveloped land, wooded land, and a portion of Pickering Brook and associated wetlands.

Potable water is obtained from the City of Portsmouth municipal drinking water supply. Sanitary waste is discharged to a private septic system and leachfield.

### **2.2 Historical Land Use**

The subject property has a history of land use as an auto salvage/crushing and recycling yard dating from circa 1960 to 2006. Automotive parts have been observed both on the ground surface and partially-buried throughout much of the property, including within the surrounding wetland area. Based on mounds observed in the southern portion of the property, it is likely that automotive parts are also buried on the site. An automobile crusher was reportedly located at a relative high point on the property along the northeastern property boundary.

In addition, the property reportedly accepted building waste and construction waste for fill in the 1960s during "Portsmouth's urban revitalization." Based on aerial photographs, the limits of the filled area had reached its maximum extent as of 1974. Related debris can still be seen within the grassed, wooded, and wetland areas on the southern portion of the property.

### **2.3 Property Identification**

NHDES Site Number:	199408047
NHDES Project Type:	HAZWASTE
NHDES Project Number:	40176
Property Name:	Former Country Motor Sales
Property Address:	375 Banfield Road Portsmouth, New Hampshire
Latitude and Longitude:	43.042° N; 70.790° W
Map and Block Number:	Portsmouth Map 266, Lot 7

Deed Reference: Book 6081 / Page 2150, Rockingham County Registry of Deeds  
Property Owner: Banfield Realty, LLC  
304 Maplewood Avenue, Portsmouth, NH 03801  
Zoning: Industrial  
USGS Topographic Quad: Portsmouth, NH (2018, 7.5 x 7.5 minute)

## 2.4 Surrounding Properties

The site is bound to the northwest by Banfield Road, to the northeast by a private school (St. Patrick Academy), to the southwest by commercial and residential properties, and to the southeast by a commercial property, beyond which are commercial, industrial, and residential properties. The site and surrounding properties are depicted on Figure 2.

Pickering Brook and wetlands associated with Pickering Brook are located on the southern, southeastern, and southwestern portion of the subject property and extend onto adjacent properties.

The residential properties within 1,000 feet of the site are assumed to be constructed with basements and are serviced by the City of Portsmouth public drinking water supply.

## 3.0 SUMMARY OF PREVIOUS INVESTIGATIONS

Several phases of work have been carried out since discovery of contaminant conditions in 2005. These efforts are summarized below.

### 3.1 2005 to 2007 Investigations – Cartier and Provan & Lorber

On August 17, 2005, Ransom Environmental Consultants, Inc. submitted a *Third-Party Notification* letter to NHDES regarding an October 2004 Phase II Environmental Site Assessment performed by Les A. Cartier and Associates, Inc. During that investigation, 11 test pits were completed, and 11 monitoring wells were installed to evaluate soil and groundwater contamination. Arsenic, lead, PCBs, and mercury were found at concentrations above NHDES S-1 Soil Standards in the vicinity of the former car crusher. Low levels of volatile organic compounds (VOCs) and PAHs were detected in groundwater. Recommendations included removal of the contaminated soil, asbestos-containing piping found in one of the test pits, all scrap metal waste, and excess, non-serviceable vehicles from the property.

In correspondence dated January 21, 2006, NHDES requested a Site Investigation. In response, a *Groundwater Monitoring and Soil Assessment Report* was submitted by Provan & Lorber, Inc. in August 2006. Ten soil borings were completed in the area of exceedances noted in the Phase II report. Arsenic was found at concentrations above S-1 Standards in soil and above Ambient Groundwater Quality Standards (AGQS) in groundwater but was attributed to natural conditions. Excavation of the contaminated soil at the former car crusher location was reported to have been successful, and a request for no further investigation was recommended.

In response to the SI, NHDES requested the following:

- Collection of additional information regarding arsenic in groundwater to determine whether additional groundwater monitoring for arsenic would be required; and
- Submittal of additional information to support a conclusion that arsenic is naturally occurring OR placement of an Activity and Use Restriction (AUR) on the former car crusher area OR removal and offsite disposal of soil where the arsenic standard is exceeded.

On July 10, 2007, Provan & Lorber, Inc. submitted an *Additional Assessment Report* to NHDES. Seven soil borings were advanced in the area of the former car crusher and excavation area, and groundwater samples were obtained from existing monitoring wells at the subject property. Arsenic was detected in 10 soil samples at concentrations exceeding the S-1 Standard. Provan & Lorber, Inc. recommended no further investigation or remediation be required at the site, stating that the arsenic exceedances appear to be naturally occurring, and action relating to the arsenic exceedances should be limited to placement of an AUR on the area with a 50-foot easement on the northeastern property boundary. NHDES concurred with the findings and issued a Letter of No Further Action dated August 15, 2007.

### **3.2 2008 Investigation – Ransom**

On October 10, 2008, Ransom Environmental Consultants, Inc. submitted a *Third-Party Notification* to NHDES regarding a Limited Subsurface Investigation at the subject property. Arsenic, lead, and mercury were detected at concentrations above applicable Threshold Effect Concentrations (TECs) and Probable Effect Concentrations (PECs) in sediment samples collected from wetland areas on the property. Lead and selenium were detected in surface water samples at concentrations exceeding New Hampshire Surface Water Quality Standards. Buried solid wastes, including automotive parts and building materials, were observed in test pits excavated in the northeastern portion of the subject property. Asbestos was detected in three waste bulk building material samples collected from surface and near-surface locations in the central portions of the site. PAHs, arsenic, lead, and PCBs were detected at concentrations above NHDES Soil Remediation Standards (SRS) in soil samples taken from test pits in the northeastern portion of the site in the vicinity of the former car crusher. Three PAHs were detected in groundwater at concentrations above AGQS in a monitoring well located on the southern portion of the site, lead was detected in groundwater at a concentration above AGQS in a monitoring well located in the central portion of the site, and arsenic was detected at a concentration above AGQS in a monitoring well located on the northwestern portion of the site.

In response to the *Third-Party Notification*, NHDES requested further investigation of the former auto car crusher area, the apparent historical solid waste landfill, asbestos in bulk soil samples, and contamination in sediment. Provan & Lorber, Inc. submitted *Comments Regarding Limited Subsurface Investigation – October 2008* to NHDES on September 2, 2009. NHDES correspondence dated February 16, 2011, recommended excavating the areas with naturally occurring arsenic in exceedance of the standard or capping the material and recording an AUR, and recommended that the source and extent of lead and PCB contamination in soil be characterized. Buried asbestos on the site was required to be capped, with the owner providing

recording of an AUR. NHDES requested information on the direction and flow rate of Pickering Brook, as well as a confirmatory round of sediment and surface water samples in the wetland area. Lastly, NHDES requested two rounds of confirmatory groundwater sampling as well as the installation of a monitoring well in the former car crusher area and analyses for VOCs, metals, PAHs, and PCBs. Based on a review of available records, the then-owner did not perform the requested work.

### **3.3 2020 Investigations – Wilcox & Barton, Inc.**

Subsequent to purchase of the property by the current owner, a Phase I Environmental Site Assessment in April 2020 confirmed the following environmental findings:

1. Documented landfill at the subject property.
2. Documented former car crusher and associated contamination at the subject property.
3. Improper storage of petroleum and/or hazardous substances, floor staining, and poor housekeeping in the northern building at the subject property.
4. Improper storage and burial of solid waste and possibly petroleum and/or hazardous substances in and around the wetland area at the subject property.
5. One floor drain in the central building garage bay at the subject property.

Follow up investigation was documented in a *Site Investigation Report* dated July 9, 2020, and a *Supplemental Data Transmittal* dated January 27, 2021. These documents are referred to herein, collectively, as the “2020 Site Investigation.” The work included advancement of 25 soil borings, five of which were completed as overburden monitoring wells, completion of 10 test pits, and collection of soil, septic tank, sediment, surface water, and groundwater samples.

Arsenic was detected in a majority of the soil samples at concentrations exceeding SRS. The detected arsenic concentrations, with one exception, were generally in the range of 12 to 20 milligrams per kilogram (mg/kg), just above SRS and not inconsistent with expected natural conditions. Lead was detected at concentrations above SRS in samples from three borings. PCBs were not detected at concentrations exceeding 1 mg/kg in any of the 100 samples that were analyzed for PCBs.

In general, test pits revealed solid waste material from ground surface to depths of 0.5 to 3.5 ft bgs in the area examined. Observed solid waste materials included bricks, tires, granite blocks, metal, car parts, wood, glass, plastic, ceramic tiles, and suspect asbestos-containing materials such as floor tiles, carpet, and mastic, and a furnace.

In groundwater, total and dissolved arsenic and lead were detected at concentrations exceeding AGQS in a limited number of monitoring wells. Similarly, one or more PFAS were detected at concentrations exceeding AGQS in a several of the wells.

In the septic tank sample, p-isopropyltoluene was detected at a concentration exceeding AGQS in the “After” sample. No PAHs were detected at concentrations above laboratory reporting limits.

In sediment, lead and arsenic were detected at concentrations exceeding SRS. No PCBs were detected at concentrations above laboratory reporting limits.

In surface water, three or more RCRA-8 metals (total) were detected at concentrations above the Water Quality Criteria (WQC) for Toxic Substances in all six surface water samples. No PCBs were detected at concentrations above laboratory reporting limits.

Based on these results, additional investigation was warranted and subsequently requested by NHDES.

## **4.0 SUPPLEMENTAL SITE INVESTIGATION**

### **4.1 Groundwater Gauging**

On August 26, 2021, Wilcox & Barton, Inc. gauged all available monitoring wells using a water level meter capable of measuring depth to water to the nearest 0.01 foot in accordance with Wilcox & Barton, Inc. Standard Operating Procedure (SOP) FP-11 – *Measuring Liquid Levels in Monitoring Wells*, which is presented in Appendix B. Depth to groundwater was in the range of 3.6 to 16.5 feet below ground surface. At monitoring well MW-2, which is located at the front of the property near Banfield Road, groundwater was at the top of casing, suggesting possible surface water flooding. Well gauging data are presented in Table 1 – *Well Gauging and Piezometric Head Elevation Data*.

The gauging data were coupled with the survey data to produce Figure 3 – *Piezometric Head Elevation Plan*. The piezometric data indicate a gradient to the southwest towards Pickering Brook, consistent with site topography and the observed high point near the former car crushing area.

### **4.2 Groundwater Sampling**

On August 27 and October 1, 2021, Wilcox & Barton, Inc. collected groundwater samples in response to the NHDES request for additional data. Samples were collected using the low-flow technique described in SOP FP-07 – *Groundwater Sampling for Volatile Organic Compounds (VOCs), Volatile Petroleum Hydrocarbons (VPH), and Extractable Petroleum Hydrocarbons (EPH)*, a copy of which is provided in Appendix B. Groundwater samples were submitted to Con-Test Analytical Laboratory (Con-Test) for laboratory analysis of:

- Total and dissolved metals in wells MW-101, MW-102, and MW-104;
- PAHs in well MW-101;
- PFAS in wells MW-1, MW-4, MW-5, MW-6, MW-7, MW-8, MW-106R, MW-109, MW-203, and MW-204.

Samples for dissolved metals and PAHs were field filtered. PFAS analyses were supported by field, trip, and equipment blanks. Water quality parameters were recorded in the field during sampling and used to gauge stabilization for low-flow sampling. PFAS samples were collected in strict adherence to the additional requirements of SOP FP-17 – *Groundwater Sampling for Per- and Polyfluoroalkyl Substances (PFAS)* (Appendix B).

All samples collected under this phase of work were packaged and handled in accordance with SOP FP-04 – *Sample Custody and QA/QC Sample Collection* (Appendix B).

### 4.3 Soil Sampling

#### 4.3.1 Lead

To provide comprehensive coverage of the site for characterization of the extent of lead contamination, a uniform grid with a spacing of approximately 50 feet was overlain on the site. Though not all grid intersections or cells were sampled, the grid intersections were used to ensure even distribution of samples.

Prior to sampling, a Wilcox & Barton, Inc. survey team visited the site and placed flags at the designated grid intersections. A combination of total station and measuring tape methods were necessitated by dense vegetation, resulting in an estimated placement accuracy on the order of  $\pm 5$  feet for each sample. A total of 80 grid intersections were marked in the field, with emphasis on areas where no prior lead data existed. Boring locations were named using a graphic approach, with alphabetical identifiers across the x-axis (A to K from southwest to northeast, Z to V from northeast to southwest in the lowland area) and numbers (1 through 15 from northwest to southeast).

On September 9 and 10, 2021, New England Boring Contractors (NE Boring) of Derry, New Hampshire, advanced soil borings using the direct-push methodology. On September 16 and 17, 2021, Geosearch, Inc. (Geosearch) of Sterling, Massachusetts, advanced the remainder of the soil borings in areas not accessible to machinery using hand-held probe techniques.

Soil in each boring was characterized using a modified Burmister System as described in the Wilcox & Barton, Inc. standard operating procedure, *FP-14 – Soil Logging and Description* (Appendix B), and visually inspected for the presence of anthropogenic material. Soil across the site generally consists of sand with varying amounts of silt and gravel. Fragments of wood, brick, rubber, plastic, ceramics, and glass were observed in small quantities in borings across the site. Soil and fill descriptions are provided in Appendix C.

Samples were collected from the 0 to 2-foot interval at each of the 80 marked locations in accordance with SOP *FP-02 - Grab and Composite Soil Sampling* (Appendix B). Samples were also collected from the 2-foot to 4-foot interval at 35 of the marked locations for assessment of the vertical distribution of lead in soil. Samples were submitted to Con-Test for laboratory analysis for lead using EPA Method 6010. Non-disposable sampling equipment was cleaned between samples in accordance with SOP *FP-06 – Cleaning/Decontamination Procedures* (Appendix B).

#### 4.3.2 PCBs

To provide comprehensive coverage of the site for characterization of the distribution of PCBs in soil, the same uniform grid deployed for lead sampling (50-foot spacing) was used. However, within the proposed development area, the grid density for PCB sampling was increased to 25-foot spacing for increased data frequency. As with lead, not all grid intersections or cells were

sampled; sample locations were selected to ensure comprehensive coverage of the site, characterize areas where human exposures are more likely, confirm prior data, and fill in data gaps from prior work.

Within the proposed development area, a Wilcox & Barton, Inc. survey team visited the site and placed flags at the designated new grid intersections using a total station, yielding a sub-foot placement accuracy. A total of 114 grid intersections were marked in the field, with emphasis on areas where no prior data had been collected.

On September 24, 2021, Geosearch advanced soil borings using hand-held probe equipment in locations inaccessible to machinery. On September 29 and 30, 2021, NE Boring returned to the site and advanced soil borings utilizing Geoprobe direct-push methods. Finally, on October 1 and 4, 2021, Wilcox & Barton, Inc. personnel advanced soil borings in the wetland buffer with a hand auger and spade due to poor sample recovery in the acetate liners.

Samples were collected from the 3 to 6-inch and 6-inch to 18-inch intervals at each of the 114 marked locations, as recommended by EPA. Samples were also collected from the 18-inch to 36-inch interval at 27 of the marked locations for additional assessment of the vertical distribution of PCBs in soil. Samples were submitted to Con-Test for laboratory analysis for PCBs using EPA Method 8082.

#### **4.4 Sediment Sampling**

To assess the impact of surface water runoff and groundwater migration from the site, a sampling program was generated for wetland sediment. Wetlands were delineated by Jones & Beach Engineers, Inc. (Jones & Beach) and marked in the field using wetland flagging. The field-marked wetland boundary was visible during the current sampling event.

Sediment samples were collected approximately every 100 feet along Pickering Brook in general accordance with guidance described in the EPA guidance *Determination of the Biologically Relevant Sampling Depth for Terrestrial and Aquatic Ecological Risk Assessment* (2001) and/or Ohio Environmental Protection Agency *Sediment Sampling Guide and Methodologies* (2001).

Additional sediment samples were collected in the wetland area adjacent to Pickering Brook on the “site side” (east/north of Pickering Brook) and “far side” (west/south of Pickering Brook). Samples on the “far side” were limited as most proposed locations were inaccessible due to tall vegetation and/or property lines. Samples were submitted to Con-Test for laboratory analysis of:

- PAHs;
- Total metals;
- Total organic carbon; and
- Grain size distribution.

Sediment samples were located using hand-held GPS (*Gaia GPS* app on iPhone), with an estimated accuracy of  $\pm 25$  feet, and by local reference to wetland flags and the streambed alignment, where visible. Collection of sediment and surface water samples is depicted in photographs presented in Appendix D.

#### **4.5 Surface Water Sampling**

Surface water samples were collected approximately every 100 feet linearly along Pickering Brook in the same location as sediment samples using a peristaltic pump. Water quality parameters were measured using a YSI water quality meter and a hand-held turbidimeter in accordance with SOPs FP-03 – *Water Quality Monitoring Using a YSI Multi-Probe System (MPS)* and FP-09 – *Field Measurement of Turbidity* (Appendix B)

Samples collected for analysis of dissolved analytes were filtered in the field using disposable 0.45 micron filters. At the direction of NHDES, work did not proceed upstream outside of the subject property boundary.

Samples were submitted to Con-Test for laboratory analysis for:

- Total and dissolved metals;
- Total and dissolved iron and manganese;
- Calcium hardness;
- PAHs;
- Chloride;
- Nitrate as N;
- Sulfate;
- Total suspended solids; and
- Total dissolved solids.

### **5.0 CONTAMINANT DISTRIBUTION**

The distribution of soil, sediment, surface water, and groundwater contamination are discussed in the following sections.

#### **5.1 Groundwater**

##### **5.1.1 Total and Dissolved Metals**

In the additional wells sampled for total and dissolved metals, arsenic and/or lead were detected at concentrations exceeding AGQS. The current and available historical data are summarized in Table 2 – *Groundwater Samples – Summary of Analytical Results*. Both current and historical results for dissolved metals are depicted on Figure 4 – *Dissolved Metals and PAHs in Groundwater*. Analytical results are presented in Appendix E.

The most recent data indicate exceedances of AGQS for lead at the three most downgradient monitoring wells along the wetland boundary along the southern extent of the upland portion of

the property and surrounding the estimated area of manmade fill and debris. Note that monitoring well MW-101, which was installed during the 2008 investigation, appears to be located within the flagged wetland boundary.

Water quality parameters were recorded in each well. The data are summarized in Table 3 – *Natural Attenuation Parameters – Summary of Field Measurements*. During sampling events in August and October 2021, groundwater was generally characterized by low dissolved oxygen concentrations, neutral pH, and slightly negative oxidation reduction potential, suggesting moderate reducing conditions.

#### 5.1.2 Polycyclic Aromatic Hydrocarbons

Historical AGQS exceedances for PAHs have been limited to benzo(a)anthracene, benzo(b)fluoranthene, and dibenz(a,h)anthracene in monitoring well MW-101. The current and available historical data are summarized in Table 2 and results are depicted on Figure 4. PAHs were not detected at concentrations exceeding AGQS in well MW-101 during the current sampling effort. Analytical results are presented in Appendix E.

#### 5.1.3 Per- and Polyfluoroalkyl Substances

Samples from wells MW-1, MW-4, MW-5, MW-6, MW-7, MW-8, MW-106R, MW-109, MW-203, and MW-204 were collected and submitted for PFAS analysis. One or more of the target analytes perfluorohexanesulfonic acid (PFHxS), perfluorooctanoic acid (PFOA), and/or perfluorooctanesulfonic acid (PFOS) were detected at concentrations exceeding AGQS in wells MW-1, MW-4, MW-7, MW-106R, MW-109, and MW-203. Results are summarized in Table 4 – *Groundwater Samples – Summary of PFAS Analytical Results* and are depicted on Figure 5 – *PFAS in Groundwater*. The data upload to the NHDES Environmental Monitoring Database is in process as of the date of this report. Analytical results are presented in Appendix E.

Wilcox & Barton, Inc. prepared a field blank and an equipment blank (using the water level meter) prior to sample collection using laboratory-provided, PFAS-free, deionized water. A laboratory-prepared trip blank was submitted with the samples. No PFAS were detected in the field blank or trip blank. One PFAS, 6:2 fluorotelomer sulfonic acid, was detected at an estimated concentration below the reporting limit in the equipment blank. No other PFAS were detected in the three quality control samples.

As an additional quality control measure, a duplicate sample was collected from monitoring well MW-5, noted as MW-301 on the chain of custody, and submitted blind to the laboratory. Analysis of the blind duplicate produced results similar to the primary result. The analytical results of the four quality control samples indicate adequate control of the field sampling process.

Current results suggest concentrated areas of AGQS exceedance for PFAS near the current actively used portion of the site near Banfield Road and downgradient of the former car crusher area. However, the distribution pattern does not reveal a specific source area and there is no new information concerning the origin of these compounds on the property. Notably, the majority of the wells near and within the wetland have not contained PFAS at concentrations exceeding AGQS during any sampling round in 2020 or 2021.

## 5.2 Soil

### 5.2.1 Lead in Soil

Soil data collected during this phase of investigation indicate the widespread presence of lead in soil at concentrations exceeding the SRS. Current and historical analytical results are summarized in Table 5 – *2020 Site Investigation Soil Samples – Summary of Analytical Results*, in Table 6 – *Soil Samples – Summary of Lead Analysis Results*, and in the historical data tables presented in Appendix F. Analytical results are presented in Appendix E.

Lead results collected during the 2008, 2020, and 2021 phases of investigation have been consolidated on Figure 6 - *Lead in Soil and Sediment*. On Figure 6, results are compared to the SRS of 400 mg/kg. (Note: Technically, SRS is not applicable for sediment samples; sediment results are compared to SRS here for illustration purposes only.) Of the 236 soil samples that have been analyzed for lead, the detected concentration has exceeded SRS approximately 25% of the time.

Lead was found at concentrations exceeding SRS over a significant portion of the site, with increased frequency near the former car crusher and throughout the suspected man-made fill area. Notably, there is an area near the lower (southern) extreme of the upland area where concentrations consistently exceed 4,000 mg/kg, or 10 times SRS.

Results indicate a vertical distribution at some locations, with concentrations exceeding SRS in the 2 to 4-foot and 4 to 6-foot intervals, but a discernible pattern is not evident. At some locations, the concentration at depth is greater than the concentration at the surface, and vice versa. Depth distribution was not assessed at all locations.

### 5.2.2 PCBs in Soil

Analytical results for PCBs in soil are summarized in Table 5, Table 7 – *Soil Samples - Summary of PCB Analysis Results*, and in the 2008 Site Investigation tables in Appendix F. The most recent result for each sampling point (boring or test pit) is depicted on Figure 7 – *PCBs in Soil*. Analytical results are presented in Appendix E.

The majority of PCB concentrations exceeding 1 mg/kg appear to be concentrated near the former car crusher area. Other occurrences are sporadic with no discernible distribution pattern. Of the 371 soil samples that have been analyzed for PCBs, the PCB concentration has exceeded 1 mg/kg in 22 of them, for an exceedance frequency of less than 6%. The total PCB concentration exceeded 10 mg/kg in three locations, with a maximum detected concentration of 17 mg/kg.

During the 2008 and 2020 investigations, assessment of vertical distribution was limited to analysis of samples composited from the 0 to 2-foot, 2 to 4-foot, and 4 to 6-foot intervals. In 2021, at the request of EPA, discrete intervals of 3 to 6 inches and 6 to 18 inches were sampled. In both cases, the shallowest interval is presumed to be representative of shallow soil where direct contact exposures are possible.

### 5.3 Surface Water

A total of six surface water samples were collected from Pickering Brook on a spacing of approximately 100 feet starting at the Banfield Road culvert and proceeding upstream. Due to the intermittent nature of the stream, surface water was not always present at the surface. At the direction of NHDES, sampling did not proceed upstream onto the adjacent property to the south.

Analytical results, along with historical data, are summarized in Table 8 – *Surface Water Samples – Summary of Analytical Results*. Results are compared to the WQC for protection of aquatic life (freshwater chronic) and for protection of human health (water and fish ingestion) published in Env-Wq 1703. WQC exceedances were detected for arsenic, lead, iron, and manganese in each of the six samples. Analytical results for these compounds are presented on Figure 8 – *Dissolved Metals in Surface Water* and on Figure 9 – *Total Metals in Surface Water*. Analytical results are presented in Appendix E.

Water quality parameters were recorded during sampling and are summarized in Table 3. Results were generally similar to those recorded in groundwater.

### 5.4 Wetland Sediments

Sediment samples were collected at locations coincident with the surface water samples and at locations representative of wetland sediments away from the stream. A total of 20 samples were collected on the subject property and within the flagged wetland boundary as observed in the field.

Current and historical wetland sediment analytical results are summarized in Table 9 – *Sediment Samples – Summary of Analytical Results*. Results are compared to Consensus-Based TECs and PECs. In the historical dataset, TEC or PEC exceedances were detected for arsenic, cadmium, lead, and mercury at various locations. In the samples from 2021, these same metals, plus chromium and one or more PAHs, were detected at concentrations exceeding screening concentrations in 19 of the 20 samples. Analytical results for sample SD-204, which is located on the opposite side of Pickering Brook near the lower end of the stream reach, did not reveal exceedance of TECs or PECs.

Analytical results are depicted graphically on Figure 10 – *Metals and PAHs in Wetland Sediments*. Analytical results are presented in Appendix E.

Each of the sediment samples was subjected to grain size analysis. Results are presented in Appendix G. Wetland sediments fell generally into three grain size distribution categories. Thirteen of eighteen samples were classified as AASHTO Silty Soils, with percentages passing the #200 sieve ranging from 35% to greater than 80%. Five samples were classified as Silty

Gravel & Sand, with two other samples classified as Gravel & Sand. Overall, the percentage of fines (% passing the #200 sieve) ranged from 17.1% to 82.6% (mean = 49.3%, standard deviation = 21.5%). There is no discernible difference in percent fines within the Pickering Brook waterway versus sediments away from the brook.

Sediment samples were also analyzed for Total Organic Carbon (TOC), with results ranging from 1,700 to 770,000 mg/kg (median = 110,000, mean = 175,135 mg/kg, standard deviation = 180,074 mg/kg). The high standard deviation indicates high variation between values and that the data are not normally distributed, further indicating variable conditions within the wetland. Both the lowest and highest TOC results were associated with samples containing a high percentage of fines. The median (central) value is likely more representative of conditions in wetland sediments and is carried into the risk calculations presented below.

## **6.0 SITE GEOLOGY AND HYDROLOGY**

Conditions encountered during the 2021 investigation were consistent with those observed during prior investigations. Brown and gray silt and fine sand with varying amounts of gravel and some solid waste, including bricks, ceramics, nails, and glass, were observed in a large percentage of the borings. A log showing soil descriptions is presented in Appendix C.

Based on StreamStats data available from the US Geologic Survey, the drainage area contributing to the wetland area and stream outlet at the Banfield Road culvert measures approximately 0.36 square miles (230 acres). A map depicting the contributing area is included in Appendix H. A desktop review of the contribution area indicates the presence of various commercial uses, including water parks, warehouse buildings, and retail.

A branch of Pickering Brook and wetlands associated with Pickering Brook are located on the southern, southeastern, and southwestern portion of the subject property and extend onto adjacent properties. The brook originates east of the site and flows northwesterly, entering the Great Bog Wildlife Management Area on the west side of Banfield Road, with additional brook branches joining, and eventually discharges to the Great Bay National Wildlife Refuge, which then flows into Piscataqua River and eventually the Atlantic Ocean.

In the draft 2020 New Hampshire Watershed Report Card ([https://www4.des.state.nh.us/onestoppub/SWQA/010600030904\\_2020.pdf](https://www4.des.state.nh.us/onestoppub/SWQA/010600030904_2020.pdf)), Pickering Brook was identified to have the following water quality impacts:

- Aquatic Life Integrity – Severe impact (PAHs, metals);
- Fish Consumption – Poor quality (fish consumption advisories in effect for PCBs and mercury);
- Primary Contact Recreation – Bad to poor quality (fecal coliform and enterococcus); and,
- Shellfish consumption – Poor to severe (dioxin, mercury, and PCB fish consumption advisories and fecal coliform).

These conditions were identified at the mouth of the brook into Great Bay (Station NHEST600030904-04-03), as well as just downstream from the site west of Banfield Road (Station NHRIV600030904-06). Excerpts from the Watershed Report card with data from monitoring points along Pickering Brook are also presented in Appendix H.

## **7.0 CONCEPTUAL SITE MODEL**

The Conceptual Site Model remains substantially unchanged since submittal of the 2020 *Site Investigation Report*. There is no new information to suggest historical uses other than as a landfill and for auto salvage operations, though the understanding of contaminant distribution has been significantly enhanced. The description below has been modified accordingly. The property has most recently been used for the maintenance and repair of vehicles, though tenants have vacated the existing structures as of November 1, 2021.

Dissolved arsenic and lead were detected in groundwater at concentrations exceeding AGQS in the most downgradient wells surrounding the area of manmade fill deposition.

Arsenic is present in soil throughout the site, but concentrations are largely consistent with expected naturally occurring conditions. Lead is present in soil at elevated concentrations exceeding SRS over a majority of the property, with a significant area showing lead concentrations exceeding 10 times the SRS value.

In sediment, metals were detected at concentration exceeding screening levels in the majority of the samples. The sediment samples are located in the wetlands surrounding the former landfill, suggesting that contamination was placed in, or has reached, the wetland area.

PFAS were detected in groundwater at several monitoring wells, though a source of PFAS has not been defined.

### **7.1 Contaminant Source**

The suspected source of contamination at the site is the historical presence of an unlined landfill, burial of demolition and automotive debris, and former automobile storage and salvage operations. The observed contaminant conditions are widespread throughout the property, extending to the wetlands associated with Pickering Brook.

### **7.2 Contaminant Distribution**

#### **7.2.1 Adsorbed Phase**

The geology in the source area consists primarily of silt and fine sand with varying amounts gravel from ground surface to a maximum depth of 18 ft bgs. Bedrock was not encountered in any boring.

There is evidence of widespread arsenic and lead concentrations exceeding SRS in soil and sediment samples; however, the detected arsenic concentrations are generally consistent with background and are thought to be naturally occurring. Lead is present in soil and sediment, with some concentrations exceeding SRS by a significant degree over a large portion of the property.

#### 7.2.2 Dissolved Phase

Dissolved phase contaminants are present in groundwater at concentrations exceeding AGQS at locations along the wetland boundary and in surface water in the wetland areas. Conditions appear to emanate from the area where manmade debris has been buried, which extends into the wetland.

#### 7.2.3 Non-Aqueous Phase Liquids

No non-aqueous phase liquids have been encountered during this or prior investigations.

#### 7.2.4 Soil Vapor

Screening for organic vapors with a photoionization detector (PID) during earlier drilling efforts did not indicate elevated concentrations of volatile compounds in soil at any location. VOCs were not detected in groundwater at concentrations exceeding GW-2 values.

### 7.3 Contaminant Migration

Dissolved-phase constituents are expected to continue migrating downgradient (both vertically and horizontally). Leaching of contaminants, particularly lead, from the adsorbed phase to the dissolved phase is likely an ongoing transformation and migration pathway. Based on current data, contaminants have reached the adjacent surface water via groundwater or via overland stormwater flow.

Piezometric data indicate a predominant groundwater flow direction to the southwest.

### 7.4 Sensitive Receptors

A sensitive receptor survey map depicting a 500- and 1,000-foot radius around the site was generated using the NHDES OneStop Data Mapper GIS system and provided in the 2020 *Site Investigation Report*. There is no new information concerning sensitive receptors aside from the human health and ecological risk assessment work presented in Section 8.0 below.

In general, potential human receptors may include residents, workers, visitors, and trespassers. Environmental receptors may include flora and fauna within and downgradient of the affected area. Potential exposure points may include wellhead protection areas, water wells, surface waters, wetlands, buildings into which vapors can migrate through basement foundations or utility connections, locations of direct soil contact (e.g., playgrounds, gardens, construction trenches), and utility corridors. Routes through which human receptors may be exposed to contaminants include ingestion, inhalation, and dermal contact.

Potential exposure pathways for receptors at the site include:

- Ingestion of Drinking Water – The site and surrounding properties are serviced by the municipal water supply. An exposure pathway via drinking water ingestion is not complete.
- Inhalation of Vapors – Basements and sub-slab utility connections represent potential pathways for vapor-borne contaminants to enter structures. The site buildings do not contain basements and no volatile contaminants have been detected in soil or groundwater at concentrations of concern; therefore, human exposure via inhalation does not appear to be a complete exposure pathway.
- Dermal Contact with Soil and Groundwater – Exposure via dermal contact for trespassers and commercial workers represents a complete pathway based on arsenic and lead contamination at concentrations above SRS from ground surface to 8 ft bgs. Dermal contact with groundwater by utility workers is a potentially complete pathway.
- Environmental Receptors (Surface Water & Sediments) – Constituent concentrations in groundwater exceed AGQS near the wetland boundary and have been detected in surface water. Impacts to surface water represent a complete exposure pathway for environmental receptors. Similarly, exposure of wetland flora and fauna as well as human trespassers to sediment contaminants is a complete exposure pathway.

## **8.0 RISK ASSESSMENT**

### **8.1 Sediment and Surface Water**

Wilcox & Barton, Inc. contracted Ms. Cyndee Fuller of Sovereign Consulting Inc. to perform a *Focused Human Health and Ecological Risk Assessment* of contaminant conditions found in wetland sediments and surface water. Ms. Fuller has over 30 years of direct and relevant experience in the evaluation of human health and ecological risks at contaminated sites in New England. While working at EPA, she participated in developing bilateral water quality standards for the Great Lakes System and served on the EPA Great Lakes Water Quality Initiative. Ms. Fuller was a founding member of the EPA Assessment and Remediation of Contaminated Sediments program and served on the EPA National Sediment Oversight Technical Committee.

The full report evaluating human health (recreational trespassers and fish consumers) and ecological (aquatic and benthic organisms) risks from exposure to wetland sediment and surface water is presented in Appendix I. The results of the quantitative assessment for humans accessing the site as recreational trespassers and/or consuming fish are shown below.

FOCUSED RISK ASSESSMENT SUMMARY				
RECREATORS/TRESPASSERS WHO CONSUME PICKERING BROOK FISH				
Exposure Pathway	Non-Carcinogenic Hazard Index			Excess Lifetime Cancer Risk
	Child	Youth	Adult	Combined <sup>[1]</sup>
Sediment ingestion	6.8	1.4	0.8	1 x 10 <sup>-5</sup>
Sediment dermal contact	0.5	0.2	0.1	8 x 10 <sup>-6</sup>
Inhalation of entrained (dry) sediment particles	0.02	0.02	0.02	7 x 10 <sup>-7</sup>
Surface water ingestion	2.7	1.1	0.3	5 x 10 <sup>-5</sup>
Surface water dermal contact	0.001	0.0008	0.0005	9 x 10 <sup>-8</sup>
Recreational fish consumption (all)	12	10	9	1.4 x 10 <sup>-5</sup>
<b>All Except Fish Consumption</b>	<b>10</b>	<b>3</b>	<b>1</b>	<b>7 x 10<sup>-5</sup></b>
<b>Total (all pathways)</b>	<b>22</b>	<b>13</b>	<b>10</b>	<b>1 x 10<sup>-4</sup></b>
<b>Maximum Acceptable Level</b>	<b>1</b>			<b>1 x 10<sup>-5</sup></b>

[1]. Age-specific cancer risks are intermediate values and are not shown; refer to risk spreadsheets.

[2]. No carcinogens in this pathway.

The total Hazard Index (HI) for each recreational trespasser age group is above the maximum acceptable HI of 1 and the excess lifetime cancer risk is above the maximum acceptable cancer risk of 1x10<sup>-5</sup>. Therefore, the site poses an unacceptable risk to human health for recreational trespassers that catch and consume fish from Pickering Brook. Health risks are also at unacceptable levels for trespassing without fish consumption, and for fish consumption without trespassing.

Site sediment contains multiple constituents at concentrations above their sediment benchmarks, suggesting that sediments are likely to be toxic to benthic organisms residing in the wetlands. Total sediment HIs for individual sample locations ranged from 11 to 780.

Site surface water contains multiple constituents at concentrations above the applicable water quality criteria, both acute and chronic, and similarly poses a potential risk to pelagic (water column) aquatic organisms. Total chronic surface water HIs for individual sample locations ranged from 2 to 20.

## 8.2 PCBs in Upland Soil

Potential health risks associated with exposure to PCBs in site soil were quantified for recreational trespassers and for future commercial/industrial workers. The risk assessor's report evaluating human health risks from exposure to PCBs in upland soil is presented in Appendix J.

Results of the risk calculations for recreational trespassers are shown below:

RISK ASSESSMENT CALCULATIONS RECREATIONAL TRESPASSERS				
Exposure Pathway	Non-Carcinogenic Hazard Index			Excess Lifetime Cancer Risk
	Child	Youth	Adult	Combined Ages <sup>[1]</sup>
Soil Ingestion	0.1	0.03	.02	$7 \times 10^{-7}$
Soil Dermal Contact	0.1	0.02	0.02	$5 \times 10^{-7}$
Outdoor Inhalation of Volatile Soil Constituents	0.0001	0.0001	0.0001	$4 \times 10^{-10}$
Inhalation of Entrained Soil Particles	0.00003	0.00003	0.00003	$6 \times 10^{-10}$
<b>Total (all Pathways)</b>	<b>0.2</b>	<b>0.05</b>	<b>0.03</b>	<b><math>1 \times 10^{-6}</math></b>
<b>Maximum Acceptable Level</b>	<b>1.0</b>			<b><math>1 \times 10^{-5}</math></b>

[1] Age-specific cancer risks are intermediate values and are not shown; refer to appendices.

Non-carcinogenic hazard indices for each age group are below the maximum acceptable HI of 1 adopted by New Hampshire, and the total cancer risk is below the maximum acceptable cancer risk adopted by New Hampshire of 1 in 100,000, denoted as  $1 \times 10^{-5}$ .

Results of the risk calculations for commercial/industrial workers are shown below:

RISK ASSESSMENT CALCULATIONS COMMERCIAL/INDUSTRIAL WORKERS		
Exposure Pathway	Non-Carcinogenic Hazard Index	Excess Lifetime Cancer Risk
Soil Ingestion	0.03	$4 \times 10^{-7}$
Soil Dermal Contact	0.02	$4 \times 10^{-7}$
Outdoor Inhalation of Volatile Soil Constituents	0.0002	$5 \times 10^{-10}$
Inhalation of Entrained Soil Particles	0.00005	$8 \times 10^{-10}$
<b>Total (all Pathways)</b>	<b>0.05</b>	<b><math>7 \times 10^{-7}</math></b>
<b>Maximum Acceptable Level</b>	<b>1.0</b>	<b><math>1 \times 10^{-5}</math></b>

As with recreational trespassers, the non-carcinogenic HIs are below the maximum acceptable HI of 1 and the total cancer risk is below the maximum acceptable cancer risk  $1 \times 10^{-5}$ .

The results of the risk assessment indicate that calculated non-carcinogenic health hazards and carcinogenic health risks are below "no unacceptable risk" benchmarks accepted by NHDES. It is concluded that the presence of PCBs in upland soil poses no unacceptable health risks and, from a risk perspective, does not require removal.

## 9.0 SUMMARY AND CONCLUSIONS

Wilcox & Barton, Inc. completed resampling of existing monitoring wells for analysis of PAHs, metals, and PFAS. In addition, a total of 115 additional soil samples were collected for analysis of lead, and 255 soil samples were collected for analysis of PCBs. Together, the groundwater and soil data from the upland area of the site have substantially increased the understanding of environmental conditions on the property.

Dissolved lead is present in groundwater at concentrations exceeding AGQS in wells surrounding the suspected manmade fill area and along the wetland boundary. In soil, lead was found at concentrations exceeding SRS over a significant portion of the site, with increased frequency near the former car crusher and throughout the suspected man-made fill area. Proper management of worker exposure and soil handling during construction will be required. In addition, development of a remedial strategy to prevent future exposures to exposed populations and to reduce concentrations in groundwater is needed.

In upland soil, PCB concentrations exceeding 1 mg/kg were generally concentrated near the former car crusher area; other occurrences are sporadic with no discernible distribution pattern. Of the 371 soil samples that have been analyzed for PCBs, the PCB concentration has exceeded 1 mg/kg in 22 of them, for an exceedance frequency of just under 6%. The total PCB concentration exceeded 10 mg/kg in three locations, with a maximum detected concentration of 17 mg/kg. Evaluation of human health risk for recreational trespassers and commercial workers concluded that the presence of PCBs in upland soil poses no unacceptable health risk and does not require removal. Proper management of worker exposure and soil handling during construction will be required.

In wetland sediment, numerous analytes were detected at concentrations exceeding TEC and/or PEC screening levels. Similarly, in the surface water of Pickering Brook, WQC exceedances were detected for arsenic, lead, iron, and manganese. A focused human health and ecological risk assessment concluded that the site poses an unacceptable risk to human health for recreational trespassers that catch and consume fish from Pickering Brook. Health risks are also at unacceptable levels for trespassing without fish consumption, and for fish consumption without trespassing.

Lead concentrations in milligrams per kilogram (mg/kg).

Lead concentrations compared to the New Hampshire Department of Environmental Services Soil Remediation Standard (SRS) for lead (400 mg/kg) per Env-Or 606.19, Table 600-2, SRS, effective June 1, 2015.

Photoionization Detector. Results in parts per million by volume (ppmv).  
 Not detected at or above the indicated laboratory reporting limit.

J Estimated concentration.

Constituent detected in method blank; sample result >5x

Constituent detected in method blank; sample result <5x  
 blank (<10x for common laboratory contaminants); result  
 changed to non-detection.

No standard established.

Sample not collected/analyzed for this compound.

**bold** Detected concentration exceeds SRS.

Not detected; laboratory reporting limit exceeds SRS.

Total Dissolved Solids	NS	NS	--	--	--	--	--

All results are in micrograms per liter (µg/L).

Detected and other selected compounds listed; all other analytes were not detected.

- U Not detected at or above the listed laboratory reporting limit
- B Constituent detected in blank; sample result is >5x blank (>10x for common laboratory contaminants); result valid.
- UB Constituent detected in blank; sample result is <5x blank (<10x for common laboratory contaminants); sample result changed to non-detection.
- J Estimated concentration
- NS No WQC established.
- bold** Detected concentration meets or exceeds one or more WQC
- bold italics** Not detected; laboratory reporting limit exceeds one or more WQC
- \* Table 1703-1 of Env-Wq 1703.21, WQC for Toxic Substances, adopted 12/01/16
- \*\* Calculated using Table 1703-2 of Env-Wq 1703.23, WQC for Toxic Substances, adopted 12/01/16
- (b) Criterion refers to the inorganic form only
- (c) Criterion expressed as a function of the water effect ratio (see Env-WQ 1703.22 (d))
- (e) Criterion applies to the sum of the concentrations of 2 or more isomer
- (f) Criterion expressed as a function of total hardness (see Env-WQ 1703.22 (f))
- (i) Criterion is dissolved metal and hardness dependent (see Env-WQ 1703.22 (i))
- (n) Criterion applies to the sum of all PCBs
- (a) Acute aquatic criterion; no chronic criterion available.
- (b) Criterion for total halomethanes.
- (c) Criterion for total chlorinated benzenes.
- (d) Criterion for total dichlorobenzenes.
- (e) Criterion for total dichloroethenes.
- (f) Criterion for total dichloropropanes
- (g) Criterion for total dichloropropenes.
- (p) Criterion for silver shall be for the protection of humans from argyria (1703.22 (p))

- \*\* Calculated using Table 1703-2 of Env-Wq 1703.23, WQC for Toxic Substances, adopted 12/01/16
- (b) Criterion refers to the inorganic form only
- (c) Criterion expressed as a function of the water effect ratio (see Env-WQ 1703.22 (d)).
- (e) Criterion applies to the sum of the concentrations of 2 or more isomer
- (f) Criterion expressed as a function of total hardness (see Env-WQ 1703.22 (f)).
- (i) Criterion is dissolved metal and hardness dependent (see Env-WQ 1703.22 (i)).
- (n) Criterion applies to the sum of all PCBs
- (a) Acute aquatic criterion; no chronic criterion available.
- (b) Criterion for total halomethanes.
- (c) Criterion for total chlorinated benzenes.
- (d) Criterion for total dichlorobenzenes.
- (e) Criterion for total dichloroethenes.
- (f) Criterion for total dichloropropanes.
- (g) Criterion for total dichloropropenes.
- (p) Criterion for silver shall be for the protection of humans from argyria (1703.22 (p))

All detected and selected other analytes listed; all others were not detected.

Results in milligrams per kilogram (mg/kg) unless otherwise noted.

U Not detected at or above the indicated laboratory reporting limit.

J Estimated concentration.

I Infaunal community impacts.

H *Hyalella azteca* (*H. azteca*) bioassay.

M Microtox bioassay.

NSL No screening level established.

-- Sample not collected/analyzed for this compound.

\*\* Results transcribed from Limited Subsurface Investigation, Ransom Environmental Consultants, Inc., October 10, 2008.

**bold** Detected concentration exceeds the lowest screening level value.

**bold italics** Not detected; laboratory reporting limit exceeds the lowest screening level value.

**SUBJECT: Portsmouth** – Country Motor Sales, 375 Banfield Road,  
DES Site# 199408047, Project # 20515

**Comments Regarding Limited Subsurface Investigation-October 2008,**  
prepared by Provan and Lorber, Inc., and dated September 2, 2009.

Dear Mr. Copeland:

The New Hampshire Department of Environmental Services (Department) has completed a review of the above referenced document and other site related documents contained in our files and we provide the following comments:

**SOIL QUALITY**

**Naturally Occurring Arsenic in Site Soils**

The Department issued a *Certificate of No Further Action* on August 15, 2007 regarding this issue. The *Certificate of No Further Action* indicated that the arsenic concentrations in soils and sediment were due to naturally occurring conditions at the site. Please be advised that although the Department does not regulate naturally occurring arsenic, appropriate care should be taken to prevent or limit site visitors/workers exposure to these soils as arsenic is present at a concentration above an established direct contact risk-based level. In similar situations the Department has recommended, but cannot require, that the exposure hazard be managed via one of the following:

1. Excavation and off-site disposal of the material at an appropriately permitted facility; or
2. Capping of the material with 24 inches of clean cover material and recordation of a Notice of Activity and Use Restriction.

If work is planned in areas where people may be exposed to arsenic a Site Health and Safety Plan should be prepared to prevent exposure to arsenic that may be present above the Department's soil standard. Residential development with these soils present would not be appropriate.

**SOLID WASTE LANDFILL**

Based on test pit data, the central portion of the site contains a solid waste landfill. Buried debris includes auto parts, brick, burned wood, concrete, ceramic/porcelain, painted wood, asphalt, roofing, crushed 55 gallon drums, sheet metal, linoleum and a house radiator. In a letter dated June 24, 2009, NHDES approved the application for registration as a pre-1981 landfill.

### **Lead Contaminated Soils**

Soil lead detections above the S-1 soil standard were observed in twelve test pits TP-101, TP-103, TP-107, TP-108, TP-111, TP-114, TP-120, TP-122, TP-123, TP-125, TP-132, and TP-133. TP-120 also contained concentrations of barium at the NH S-1 standard. Lead concentrations detected in on-site soils ranged from 4,060 mg/kg to 24 mg/kg relative to the Soil Remediation Standard of 400 mg/kg. The presence of lead above established standards requires additional characterization and/or remediation.

Based on the available data it appears likely that lead above regulatory standards exists beyond the area of previous testing. The extent of contamination must be determined by analyses demonstrating a clean edge to the impacted areas (i.e. laboratory results below regulatory standards).

### **PCB Contaminated Soils**

Surface soil in the northern portion of the property where auto crushing activities previously occurred contains polychlorinated biphenyls (PCBs), arsenic and lead in excess of the New Hampshire Soil Remediation Standards (NH S-1) (Env-Or 602). As previously indicated, the elevated soil arsenic concentrations were determined to be related to natural conditions. PCB concentrations detected in the soils in this area of the site ranged from non-detect at TP-122 to 8.630 mg/kg PCB-1254 and 4.300 mg/kg PCB-1.260 in TP101.

The presence of PCBs and lead above established standards requires additional characterization to determine:

1. Whether the PCB-containing soils are regulated under the Toxic Substances Control Act (TSCA). Note that the requirement for further review by the EPA Region 1 PCB Coordinator is a function of: (a) source; (b) concentration; and (c) date of release;
2. The source and full nature and extent of the lead and PCB contamination; and
3. Appropriate remedial actions/exposure risk management strategies.

If sufficient information to address these three requirements is not provided, the Department will need to confer with the EPA Region 1 PCB Coordinator for a determination of TSCA applicability to the site.

### **BURIED ASBESTOS**

The central portion of the site reportedly contains buried asbestos which may be managed by removal in accordance with Env-Sw 2100. If buried asbestos that was placed prior to 1981 is left in place, the affected areas must be properly capped, and the site managed by an Activity/Use Restriction (AUR) attached to the deed. The following link provides additional guidance: <http://des.nh.gov/organization/commissioner/legal/rules/documents/env-sw2100.pdf>

### **SEDIMENT IMPACTS**

Analyses of sediment samples collected from wetland areas located along the southeastern and southern portions of the site indicated exceedances of the threshold effects concentration for arsenic, lead, and mercury. Apparently, no upstream/background sediment or surface water samples were collected to confirm that the contamination is due to site related activities and not the result of upstream conditions.

The Department requests that the direction and rate of flow in the wetland area be determined and a confirmatory round of analyses at SD-101, SD-102, and SD-103 be conducted and compared to data from upstream sample locations to be selected outside of the area impacted by the site (i.e. at the upstream property boundary).

### **GROUNDWATER QUALITY**

Groundwater at MW-101 in the central portion of the site contained the polycyclic aromatic hydrocarbons (PAH) benzo[a]anthracene, benzo[b]fluoranthene, benzo[a]pyrene at concentrations at or above their AGQS standard. The Department agrees that based on specific PAH compounds present in soils at the site, the presence of burned wood in soils, and the chromatographic fingerprint of TPH-DRO in the sample collected from TP-122 that the concentrations of soil PAH detected are likely due to the presence of partially burned wood in the soil samples. Although soils containing contaminants solely due to the presence of wood ash or coal ash are usually exempt from regulation under Env-Or 600 (Contaminated Site Management), these soils would be regulated under Env-Or 600 if the contaminants are present in groundwater at concentrations above the corresponding Ambient Groundwater Quality Standards (AGQS). **The Department requests two rounds of confirmatory analyses from MW-101 for dissolved lead, barium and PAH.** The Department recommends the use of the EPA Low Flow sampling methodology during collection of groundwater samples for PAH analysis. If the low flow sampling method is used, the Department requires submittal of all related field notes, equipment calibration logs, and documentation of aquifer stabilization parameters with the summary report. Groundwater lead analyses from MW-102 (15 ug/l) & MW-104 (16 ug/l) documented detections at or above AGQS. Therefore, continued monitoring of groundwater at this location for dissolved metals is required to assess the significance and validity of these reported AGQS violations and to determine the extent of the dissolved metals plume in the vicinity. Based on the detections of PCBs in soils at the car crusher area **we request installation of a monitoring well in the former car crusher area to determine if groundwater is impacted.** Groundwater analyses should be for VOCs, metals, PAHs, and PCBs.

### **SURFACE WATER QUALITY**

Selenium was detected in all three surface water samples at concentrations above Surface Water Quality Criteria. Lead was detected in SW-103 at a concentration of 19.11 ug/l exceeding Surface Water Quality Criteria. To confirm that the contamination is due to site related activities and not the result of upstream conditions the Department requests that the direction and rate of flow in the wetland area be determined and a confirmatory round of analyses at SW-101, SW-102, and SW-103 and selected upstream "background" locations be conducted and the data from SW-101, SW-102 and SW-103 be compared to data from upstream sample locations to be selected outside of the area impacted by the site.

### **REQUESTED ACTIONS**

Submit a work scope to the Department before April 15, 2011 which fully assess site conditions and at a minimum includes the following:

- Two rounds of confirmatory groundwater monitoring for dissolved metals at well locations MW-102 and MW-104 (field filtered using a 0.45 micron filter prior to acidification).

- Two rounds of confirmatory groundwater monitoring at MW-101 for PAHs using EPA low flow sampling method (not filtered). PAHs can migrate in groundwater on colloids and filtering removes the colloids.
- Sediment and surface water sampling with added emphasis on determining contaminant concentrations at the upstream property boundary. Collect new sediment and surface water samples from both upstream "Background" and downstream "same locations previously sampled" and compare the analytical results to determine if the samples previously shown to be impacted are due to site activities or from an off-site source.
- Fully characterize the source and extent of the lead and PCB contamination in soil, sediment and surface water.
- Fully characterize the PCB impacted areas (i.e. assess the source, nature and extent of PCB contamination in soils and groundwater).
- Submit a report that **fully** complies with the requirements of Env-Or 606.03 (Site Investigation Report) and includes a preliminary technical and financial evaluation of three remedial alternatives to address each impacted media

We thank you for your continued cooperation. Should you have any questions, please contact me at the NH-DES Waste Management Division at the letterhead address, by E-mail or by phone.

Sincerely,

DES Site #199408047, Project #40176

**Supplemental Data Transmittal**, prepared by Wilcox & Barton, Inc. (W&B),  
dated January 27, 2021

**Site Investigation Report**, prepared by W&B, dated July 9, 2020

Dear Mr. Graham:

The New Hampshire Department of Environmental Services (NHDES) has reviewed the Supplemental Data Transmittal and Site Investigation (SI) Report submitted for the above-referenced site (Site). NHDES understands that some SI activities were completed in response to our letter dated February 16, 2011. Based on review of the SI Report, data transmittal and historical submittals, NHDES offers the following comments:

Soil

- During May 2020, 25 soil borings were advanced in the northeastern portion of the Site and 94 soil samples were collected for laboratory analysis of metals and polychlorinated biphenyls (PCBs). Arsenic was detected in all samples, including at concentrations exceeding the Soil Remediation Standard (SRS) in 70 of the samples. The concentrations were generally in the range reported previously for soil samples collected at the Site, which NHDES concluded in a letter dated August 8, 2007 were due to naturally occurring conditions. As such, the arsenic present in Site soil appears to be a background condition as defined in NH Code of Administrative Rules Chapter Env-Or 600 (*Contaminated Site Management*), Part Env-Or 602.03. In these cases, per Env-Or 606.19(f), NHDES does not require further investigation or remediation of the arsenic.
- Lead was detected at concentrations exceeding the SRS in samples collected from boreholes SB-6, SB-10 and SB-14 advanced in the northeast portion of the Site during May 2020. Lead was also detected in soil samples collected from this portion of the Site during previous assessment work (e.g. Limited Subsurface Investigation report prepared by Ransom Environmental Consulting, Inc. [Ransom] dated October 10, 2008) at concentrations exceeding the SRS. It appears the lead is the result of releases associated with former Site activities, including automobile storage, crushing and salvage operations. NHDES generally concurs with W&B's recommendation to manage lead-impacted soil in this area of the Site via placement of a suitable cap or cover and recordation of an Activity

(603) 271-2908 • Fax: 271-2181 • TDD Access: Relay NH 1-800-735-2964

and Use Restriction (AUR). ***A soil management plan (SMP) shall be submitted to NHDES that describes the management of soil during upcoming Site redevelopment activities, to include excavation activities, any temporary onsite storage, reuse, and any offsite disposal of soil conducted in accordance with Env-Or 611. Commencement of redevelopment activities that involve disturbance of soil shall not occur until NHDES has reviewed the SMP.*** Submittal of the Application for AUR shall include a requirement to prepare a separate SMP for management of any soil that may be disturbed during future Site activities. The plans for capping or covering lead-impacted soil and the SMPs must incorporate the results of historical investigations including pertinent analytical data for all soil samples.

Soil samples were collected from test pits completed in the central, lowland portion of the Site by Ransom during October 2008 as part of the investigation referenced above and analyzed for metals. Lead was detected at concentrations exceeding the SRS in the samples collected from test pits TP120, TP122 and TP123. Some detected concentrations (e.g. 4,060 milligrams per kilogram [mg/kg] at TP120) indicate a gross level of contamination. We understand this portion of the Site is the location of a pre-1981 landfill and the waste is the source of the lead in soil. NHDES is concerned the waste and impacted soil may: 1) be a source of metals contamination identified in Site surface water and sediment; and 2) pose a direct-contact exposure risk to humans. The Remedial Action Plan (RAP) discussed below shall include evaluation of remedies for the waste and contaminated soil in the area of the landfill.

- PCBs were detected at concentrations up to 0.80 mg/kg (total of all Aroclors) in 13 of the samples collected from the soil borings advanced in the northeast portion of the Site during May 2020. PCBs were also detected at concentrations up to 12.93 mg/kg (total of all Aroclors) in samples from this portion of the Site during previous assessment work (e.g. Ransom, 2008). It appears the PCBs are the result of releases associated with former Site activities, including automobile storage, crushing and salvage operations. In accordance with our letter dated February 16, 2011, options for management of PCB-containing soils must be considered. Such consideration should include whether the PCB-containing soils are regulated under the Toxic Substances Control Act (TSCA), which includes assessment of their source, date of release, and concentrations. Please note that United States Environmental Protection Agency Region 1 PCB coordinator Kimberly Tisa is an available resource regarding TSCA applicability.
- Asbestos was identified via laboratory analysis in bulk waste samples collected from test pits excavated in the area of the landfill during previous assessment work (Ransom, 2008). W&B identified suspect asbestos-containing material (ACM) in test pits advanced in the area of the landfill during May 2020. Options for management of ACM must be considered.

***NHDES requests that a Remedial Action Plan (RAP) be prepared in accordance with Env-Or 606.10 and Env-Or 606.12 for the contaminated soils and waste including metals, PCBs, and asbestos. We are amenable to discussions with W&B regarding the due date for submittal of the RAP.*** Figures presented in the RAP should show key site features such as areas of former automobile storage, crushing and salvage operations, the landfill, septic systems and

leach fields (both historical and current). We understand the evaluation of remedial alternatives will include capping or cover of contaminated soil and waste and recordation of an AUR.

### Groundwater

- Relatively elevated concentrations of lead and other metals including arsenic, barium and cadmium were detected in samples collected during June 2020 and January 2021 from wells MW-101, MW-102 and MW-104. These wells appear to be located within or hydraulically downgradient of the landfill. To assess the potential for groundwater to be a contaminant migration pathway from the landfill to surface water and sediment, we request that additional sampling be completed of wells MW-101, MW-102 and MW-104 for analysis of total and dissolved metals. Field-based water quality parameters (e.g. temperature, dissolved oxygen, pH, conductivity, oxidation-reduction potential, and turbidity) should also be collected during the sampling.
- The PAH benzo(b)fluoranthene was detected at a concentration slightly exceeding the AGQS in the sample collected from monitoring well MW-101 during June 2020. We request that an additional sample be collected from this well for analysis of PAHs. We recommend the sample be filtered in the field.
- Various per- and polyfluoroalkyl substances (PFAS) were detected in samples collected from Site monitoring wells during June 2020 and/or January 2021. Perfluorooctane sulfonic acid (PFOS), perfluorohexane sulfonic acid (PFHxS), and perfluorooctanoic acid (PFOA) were detected at concentrations exceeding applicable AGQS. Based on these results, we request that additional sampling of wells MW-1, MW-4, MW-5, MW-6, MW-7, MW-8, MW-106R, MW-109, MW-203 and MW-204 be completed for analysis of PFAS. Please continue to analyze samples for a broad list of PFAS to aid in understanding potential sources, nature and extent of PFAS at the Site. We recommend that Quality Assurance/Quality Control samples (e.g. field blank, equipment rinsate blank, and trip blank) be analyzed for PFAS and the results considered when evaluating data quality/usability. All potential sources of PFAS and contaminant migration pathways should be considered when developing the conceptual site model (CSM), to include the storage and use of PFAS-containing products, knowledge of any releases of such products, and any application of fire suppressing foam.

We request upload of all PFAS data to the NHDES Environmental Monitoring Database (EMD). Instructions for EMD upload can be found at the following link: <https://www4.des.state.nh.us/nh-pfas-investigation/wp-content/uploads/pfas-emd-guidance.pdf>

***Please submit results of the additional groundwater monitoring with the RAP. Pending our review, an Application for Groundwater Management Permit may be requested for the Site.***

### Sediment and Surface Water

- W&B collected sediment samples during May 2020 from locations identified as SD-101 through SD-106 for analysis of PCBs and metals. PCBs were not detected at concentrations above the laboratory reporting limit. Various metals were detected including lead at concentrations up to 940 mg/kg. The nature of these sediment samples is not fully explained in the SI Report. Based on Figure 3, it appears some of the samples were collected from areas identified as wetland and some were not. It's not clear if any of the samples were collected from Pickering Brook. We request that more information be provided, including sediment descriptions/classification and photographs of representative sediment and the sampling locations. An evaluation of the potential for direct-contact exposure to humans should also be provided.
- Surface water samples were collected during May 2020 from locations identified as SW-101 through SW-106 for analysis of PCBs and total metals. The samples were apparently collocated with the sediment samples. PCBs were not detected at concentrations above the laboratory reporting limit. The metals data provided in the SI Report needs to be supported by the following:
  1. For comparison of cadmium, chromium, lead and silver data to the protection of aquatic life freshwater criteria presented in Table 1703-1 of Env-Wq 1703.21, hardness data must be collected concurrently and used to calculate appropriate criteria values. The water effect ratio should be considered when determining appropriate criteria values for arsenic, cadmium, chromium, lead, mercury and silver (see Env-Wq 1703.22[d]). Additionally, the total concentrations must be converted to dissolved concentrations for arsenic, cadmium, chromium, lead, mercury and silver, with the results for silver compared to the acute exposure criteria. Results of the other metals may be compared to chronic criteria. Refer to equations and tables in Env-Wq 1703.23 and Env-Wq 1703.24 to calculate applicable criteria.
  2. Information regarding whether comparison of the metals data to the protection of human health criteria presented in Table 1703-1 is applicable. Specifically, please assess whether water and fish from Pickering Brook and the wetland system are consumed by humans.
  3. Information regarding the hydrology of Pickering Brook and the wetland system to improve the CSM. Specifically, prepare a figure that shows the direction of surface water flow and the location and interconnectedness of specific streams. The figure would benefit from inclusion of ground surface topography, showing locations of drainages and swales at the Site. Sample locations SW-101 through SW-106 should be depicted on the figure.
- Some details (e.g. property boundaries and location of wetlands) of the Site Plan presented in the SI Report do not correspond with that presented in the set of plans titled Commercial Site Plan "Industrial Warehouse" prepared by Jones & Beach Engineers, Inc.

and submitted to NHDES' Wetlands Bureau and Alteration of Terrain Bureau to facilitate review of applicable permits. Please ensure Site features are accurately depicted on figures included in the RAP and any future submittals.

- The lead analytical results presented in Table 3 of the SI Report for sample SW-101 differ from that in the laboratory analytical report. Please address such discrepancies for future submittals.

***Additional surface water sampling at locations SW-101 through SW-106 for analysis of metals and hardness is warranted. Field-based water quality parameters should be collected during the sampling. Please submit results of the additional surface water sampling and the information requested above for sediment and surface water with the RAP. Submittal of an addendum to the RAP for these media may be requested at a later date.***

Please note, the contamination at the Site will be managed under HAZWASTE Project #40176. This project number should be identified on all future submittals.

Should you have any questions regarding this letter, please contact me at NHDES' Waste Management Division.

Sincerely,

Scott Drew, P.G.

Concord, NH 03302-0095

**RE: Former Country Motor Sales, 375 Banfield Road, Portsmouth  
Response to NHDES Comments**

Dear Mr. Drew:

Thank you for your timely review and August 9, 2021, comments concerning the recent site characterization efforts at the reference site. Pursuant to our teleconference on August 20, 2021, we have prepared the following response to lay out our plans for collection of the requested data.

To facilitate discussion, we have separated the issues at the site into five categories:

1. Groundwater quality
2. Lead in soil
3. PCBs in soil
4. Asbestos in fill materials
5. Wetland sediment and surface water quality

## **Groundwater Quality**

As noted in prior reports, elevated concentrations of lead and/or arsenic were detected in unfiltered samples collected from wells MW-1, MW-102, MW-105, and MW-203 in June of 2020. Subsequent analysis of samples from these wells for dissolved metals (field filtered) did not produce exceedances of Ambient Groundwater Quality Standards (AGQS). Analysis of unfiltered samples for polycyclic aromatic hydrocarbons (PAHs) revealed an AGQS exceedance for benzo(b)fluoranthene in well MW-101. The measured concentration was 0.11 micrograms per liter (ug/L) vs. an AGQS of 0.1 ug/L.

Based on these results, it is our position that groundwater quality in upland areas of the site is not a significant concern and that migration via groundwater is unlikely to be the predominant pathway for impacts to wetland sediments and surface water. Rather, overland flow from former active operational areas is a more likely pathway.

Historical research by our firm and by others has not revealed a likely source for the per- and polyfluoroalkyl substances (PFAS) that have been detected in groundwater. With submittal of a Remedial Action Plan, we will consider the potential sources and migration pathways for PFAS.

On August 26, 2021, Wilcox & Barton, Inc. gauged all accessible monitoring wells and collected the following samples:

1. Filtered and unfiltered samples for analysis for metals (both total and dissolved) in wells MW-101, MW-102, and MW-104. Temperature, dissolved oxygen, pH, conductivity, oxidation-reduction potential, and turbidity were also recorded in the field.
2. One filtered sample for analysis for PAHs in well MW-101.
3. Samples for analysis for PFAS (21 compound list) in wells MW-1, MW-4, MW-5, MW-6, MW-7, MW-8, MW-106R, MW-109, MW-203 and MW-204.

Analytical results will be reviewed upon receipt and presented in the Remedial Action Plan. PFAS data will be uploaded to the NHDES Environmental Monitoring Database upon receipt.

### **Lead in Soil**

As discussed during our call, we have consolidated all the available lead data onto a site figure, which is attached as Figure 1. The data show exceedances of the Soil Remediation Standard (SRS) for lead at sporadic locations across the site. The data do not show a consistent pattern of distribution. To facilitate evaluation of future risk, we've also shown the proposed development areas (areas to be capped by building or pavement).

To complement the dataset, we are proposing to cover the rest of the non-wetland area of the site with lead samples. In "undisturbed" areas, we propose to sample the top 2 feet in order to assess future direct contact risks, but will also collect some deeper samples in the areas where Ransom found higher concentrations during test pit sampling. In the cut/fill/building cap areas, we propose to sample from 0-2' and 2'-4' for use in soil management during construction. The proposed sample locations are shown on the figure, as are the areas that will be capped by asphalt or building. Please note that the site is heavily overgrown and some modification of the proposed sample distribution may be required.

The long-term plan to address lead in soil includes capping of the former active areas of the site (via building or pavement) and application of a land use restriction over other areas to prevent future disturbance and land uses that are inconsistent with the presence of contaminants in surface soil.

### **PCBs in Soil**

As for lead, we have consolidated the available PCB data onto a single figure, which is attached as Figure 2. The distribution of PCBs at concentrations exceeding 1 milligram per kilogram (mg/kg) appears to be limited to the area around the former car crusher. The frequency of detection is relatively low when viewed within the entire dataset.

We have initiated a discussion with Kimberly Tisa at EPA Region 1, who has requested that NHDES be brought into the conversation going forward. We will copy NHDES on all future correspondence. In her most recent email, Ms. Tisa was non-committal about future plans, but

seemed to express confidence that the PCB issue would fall under the Toxic Substances Control Act (TSCA) and that additional data would be needed to support a cleanup/closure decision.

We have reviewed the relevant guidance (*PCB Site Revitalization Guidance Under TSCA*) and are confident that the area can be characterized as a Low Occupancy Area, where the applicable cleanup level is 25 mg/kg. Material characterized as “bulk PCB remediation waste” would be consolidated under the building or paved areas, and otherwise subject to a land use restriction as required by TSCA.

It is our intention to submit a proposal for collection of additional samples, with the aim of gaining EPA approval for a Self-Implementing Cleanup. When development work is complete, confirmation sampling will be required in accordance with the requirements of Subpart O of 40 CFR Part 761 or a risk-based sampling plan approved by EPA. Ideally, the confirmation work can be limited to areas outside the building and pavement cap, reducing the area to be confirmed.

### **Asbestos in Fill Materials**

Figure 3 presents a consolidation of all asbestos observations during prior work. Both suspect and lab-verified materials are included. As we discussed, we are proposing no further action for these landfill materials other than implementation of a land use restriction to prevent future disturbance.

### **Wetland Sediment and Surface Water Quality**

We have engaged the services of a risk assessor with expertise in sediment quality. Together, we have developed and are proposing the following program of investigation. Approximate sample locations are depicted on the attached Figure 4.

1. Sediment samples will be collected as vertical, discrete grab samples from a depth of 0 to 6 inches in accordance with generally recognized guidance for sediment sample collection, such as US EPA (2001) *Determination of the Biologically Relevant Sampling Depth for Terrestrial and Aquatic Ecological Risk Assessment* or OhioEPA (2001) *Sediment Sampling Guide and Methodologies*.
2. Surface water samples will be collected at each sediment sampling location where standing water is present.
3. At least three sediment and surface water samples will be collected from the stream only (not wetlands) upgradient of the pond to show the range of background coming into the study area.
4. Site characterization samples will be collected as follows:
  - One sample at the upstream entrance to the pond.
  - One sample midstream of the pond, nearer to site.
  - One sample at the exit of the pond.
  - Samples mid-stream every ~100 feet laterally down the stream to Banfield Avenue (~14 samples).

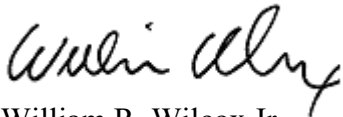

- Samples along the nearest (site side) wetland edge (where water is present) every 100 feet laterally down the stream to Banfield Avenue (perpendicular to flow into stream, where possible) (~9 samples).
  - Samples along the far side of the stream in wetland areas along just the eastern side of property to identify off-site influences, if any, as well as the extent of impacts to the wetland (~10 samples)
5. Sediment samples will be analyzed as follows. All reporting limits must be low enough for comparison to the relevant benchmarks, where they exist.
- Total organic carbon
  - Grain size
  - Extractable petroleum hydrocarbons
  - PAHs with low reporting limits
  - PCBs (if required by NHDES, not detected in sediment to date)
  - RCRA-8 metals
  - Any other constituents of concern including PFAS as requested by NHDES
6. Surface water samples will be analyzed as follows. All reporting limits must be low enough for comparison to the relevant benchmarks, where they exist.
- Calcium carbonate hardness (in mg/L)
  - RCRA-8 metals (total and dissolved/filtered)
  - PAHs (dissolved/filtered)
  - PCBs (if requested by NHDES)

This program is designed to create a sample set suitable for characterization of human health and ecological risks associated with wetland and surface water quality and to better characterize impacts to the wetland from historical site operations.

After the data collection efforts described herein have been completed, we will notify you and present concepts to be included in a Remedial Action Plan. We look forward to your continued input and to reaching a mutual agreement and site condition that can allow this property to be put back into productive use. If you have any questions, or require additional information, please do not hesitate to contact me.

Very truly yours,

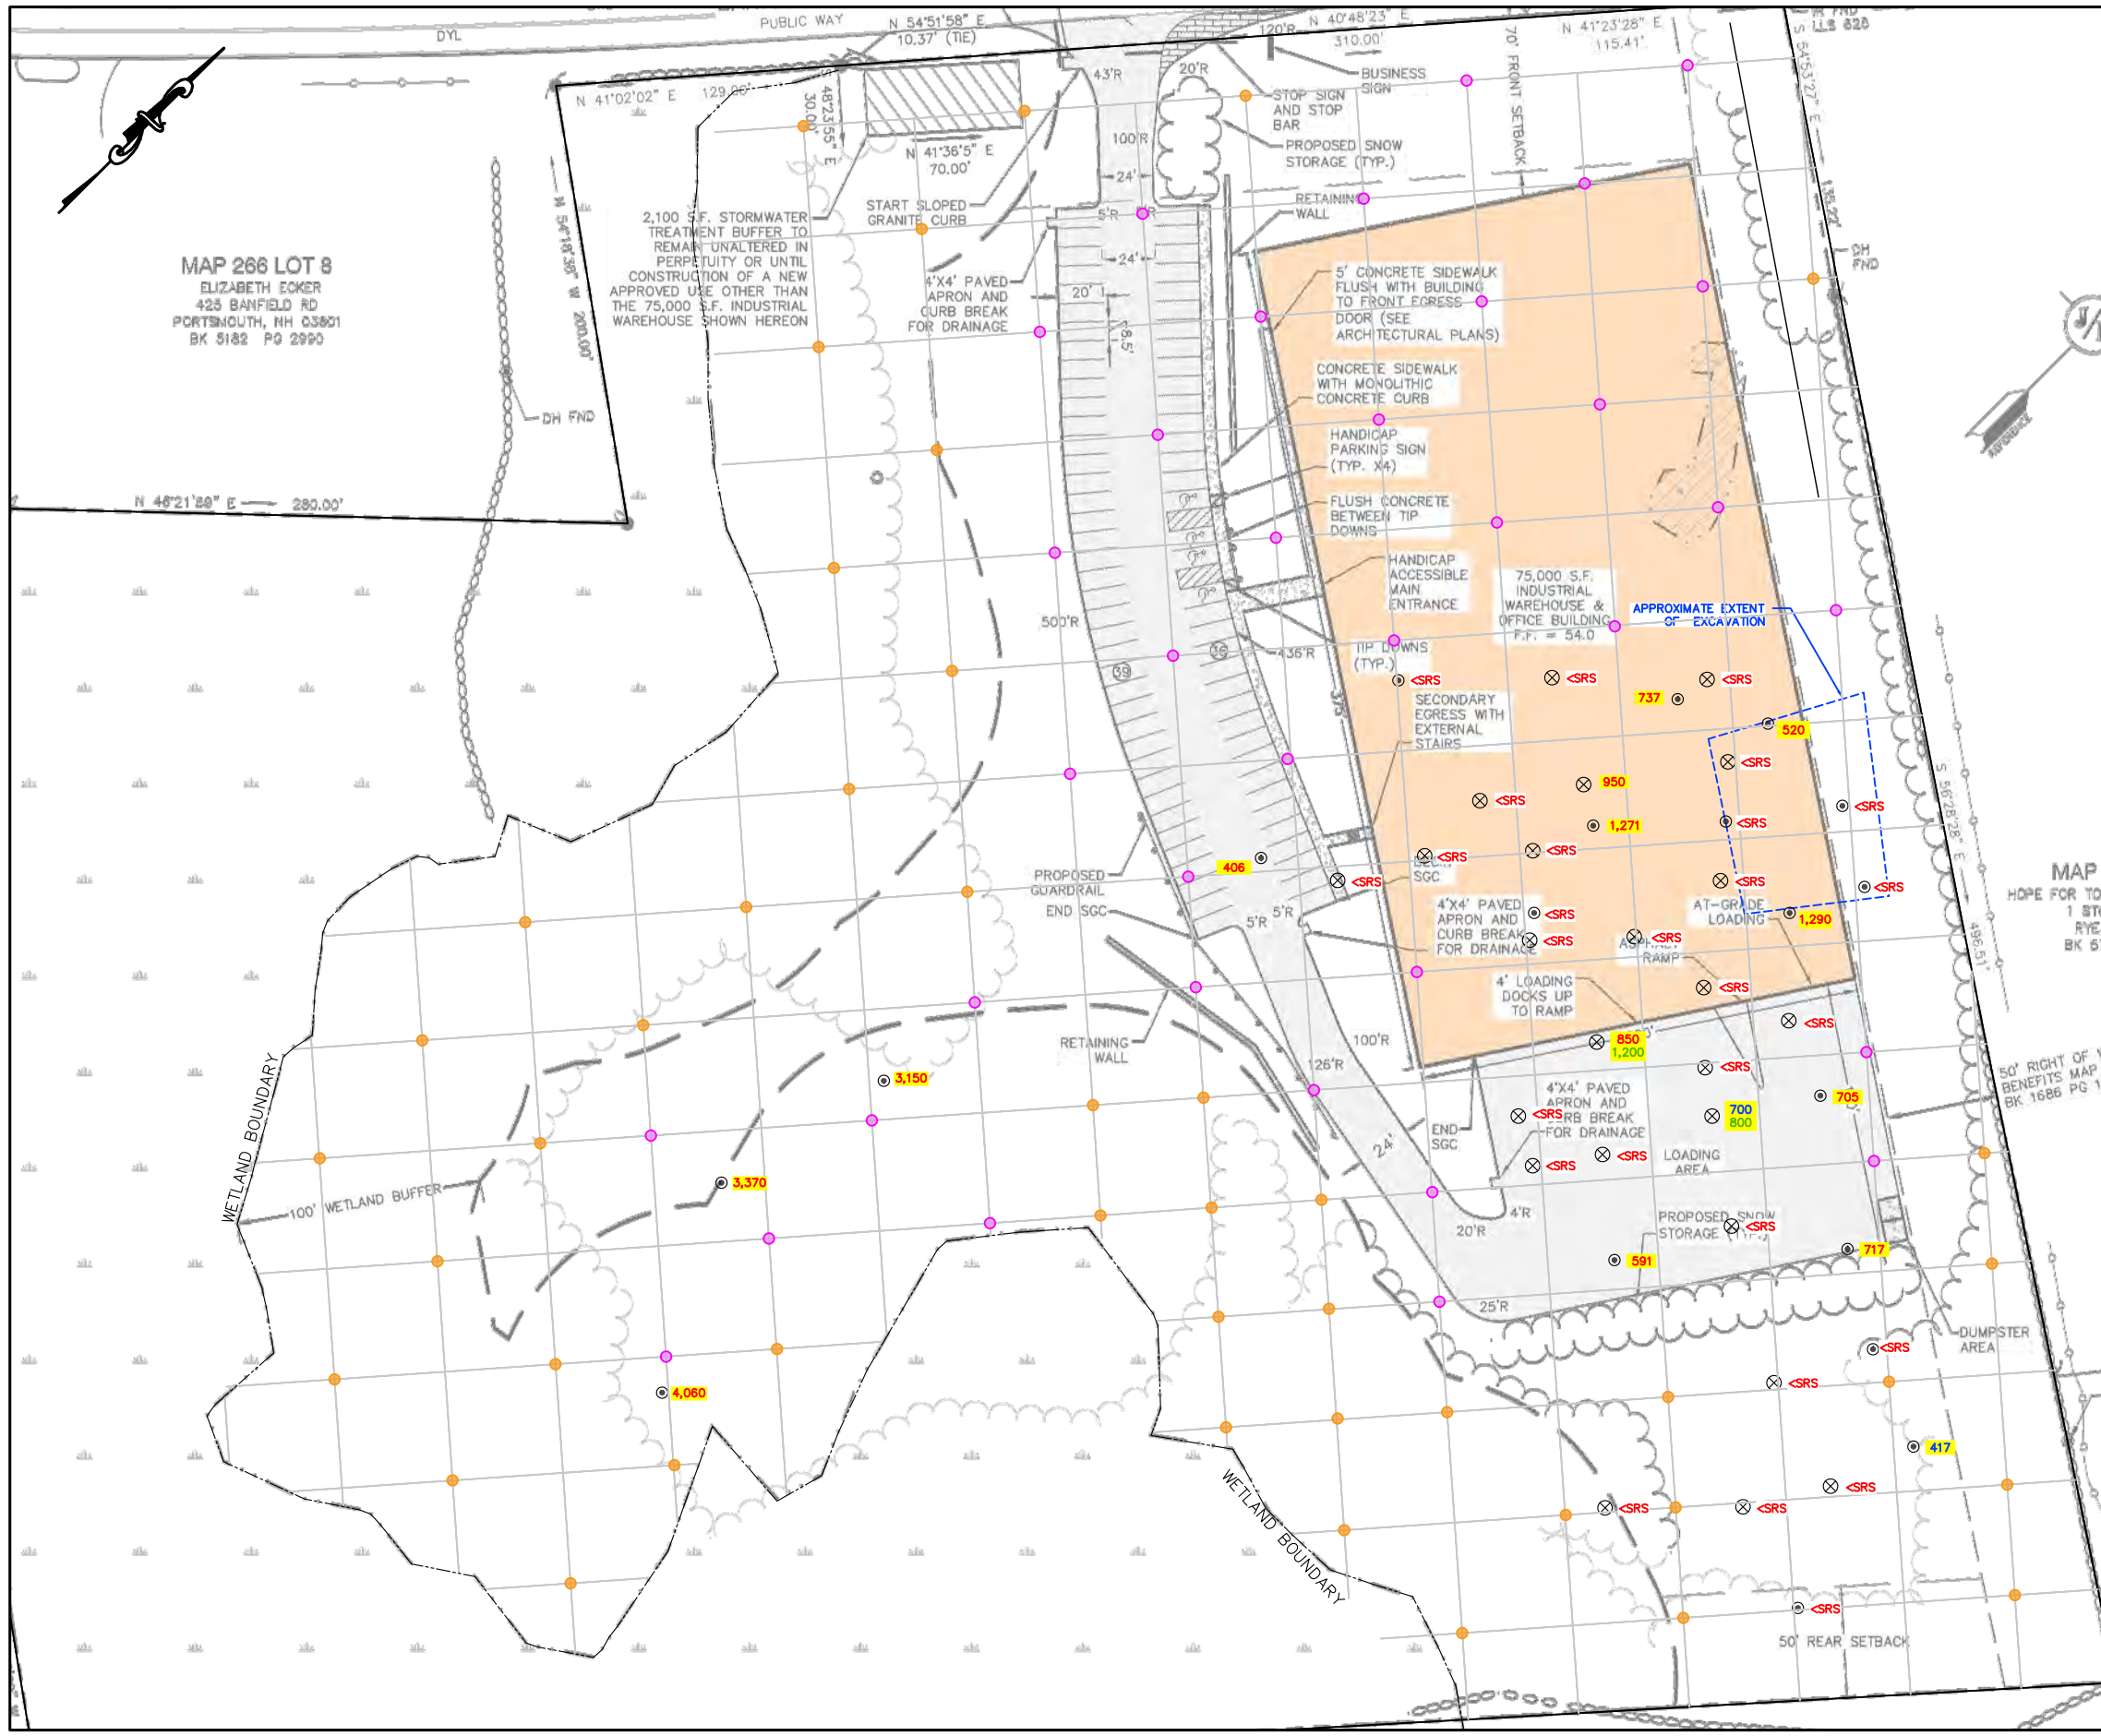

**WILCOX & BARTON, INC.**

William R. Wilcox Jr.  
President – Principal Geologist

Hi Bob,

Thank you for the update. Please upload the response to comments (RTC) document to OneStop (NHDES #199408047, Project #40176).

In regard to the wetland sediment and surface water quality assessment described in the RTC document, we offer the following comments:

- Please collect field-based water quality parameters (temperature, dissolved oxygen, pH, conductivity, ORP, and turbidity). Based on the results of previous sampling and analysis, we do not request additional sediment or surface water sample collection for analysis of PCBs. While we are not opposed to collection of samples for analysis of PFAS, we are not requesting it at this time.
- We understand that waste disposed in the pre-1981 landfill is either in direct contact with wetland surface water and sediment and/or is located immediately upgradient of the wetland. As such, we are concerned the waste and associated impacted soil may be a source of contamination detected in the wetland system. In this regard, please consider analyzing select surface water samples (proximate to and downstream of the landfill, along with at least one sample from upstream) for the following constituents: iron, manganese, ammonia, chloride, nitrate, sulfate, total suspended solids, and total dissolved solids. A package of major ions/wet chemistry may be appropriate for a few samples to better understand water chemistry. We are of the opinion that analyzing select samples for these additional constituents will aid in understanding the connection, if any, between the landfill materials and the wetland system. The density of proposed collocated sediment/surface water samples appears more than adequate. We are amenable to a reduction in samples in order to fit the above-mentioned analyzes into the scope of work/budget, if needed.
- The scope of work described in the RTC document is focused on sample collection and analysis. Please proceed with collecting the additional information requested in our letter dated August 9, 2021, or reach out to discuss why any items are planned for omission from the assessment work.

We have no comments regarding the scope of work for additional groundwater and soil assessment. The work described appears to be in line with our previous communications. Please include us on correspondences with EPA regarding the PCBs. It's our understanding that Ms. Tisa has requested our attendance on conference calls regarding this issue.

Best,

Scott Drew, P.G.

---

Hi Scott-

We have prepared the attached as a formal response to you comments concerning data collection efforts at the subject site.

To date, the groundwater sampling has been completed and lab results are pending. Today, we began laying out the sample points for lead, but found much of the site to be heavily overgrown and completely inaccessible without extensive clearing inside the wetland buffer. We will proceed with lead sample collection and see what sort of coverage we are able to obtain.

For PCBs, our next steps will include a call with Kimberly Tisa, which we are working to coordinate.

Best regards—

Bob

PS Please let me know if this submittal should be uploaded to OneStop. Thx.

## **APPENDIX B**

### **Wilcox & Barton, Inc. Standard Operating Procedures**

## STANDARD OPERATING PROCEDURE

<b>Title:</b>	Grab and Composite Soil Sampling	<b>No:</b>	FP-02
<b>Approved:</b>	R. Rooks	<b>Original Date:</b>	3/30/2017
<b>Revised:</b>			

Purpose:

To ensure data quality by collecting representative soil samples for laboratory analysis.

Equipment/Materials:

1. Sample containers, preserved and handled as required for the specific media and analyses
2. Analytical chain-of-custody form(s), sample label(s), and sample custody seal
3. Coolers or other containers for transporting samples
4. Packing materials and ice
5. Appropriate clothing/PPE as specified in the health and safety plan
6. Site plan
7. Field log book or field data form
8. Stainless steel or polyethylene scoop/trowel
9. Stainless steel or polyethylene mixing bowl (for composites)
10. Sample collection equipment (hand auger, split-spoon, shovel, etc.)

Procedure:

1. Before sampling, confer with the laboratory performing the analyses to make sure the required data quality objectives and reporting requirements will be met.
2. Obtain appropriate sample containers from the laboratory.
3. Wear dedicated nitrile gloves for each discrete sample collected. Change gloves between sample locations.

**Grab Samples** – Grab samples are samples collected from a discrete location. Soil samples may be collected using dedicated or reusable equipment. All reusable sample equipment must be decontaminated between sample locations in accordance with **SOP# FP-06**.

1. Using the appropriate soil collection method and equipment based on site conditions and the contaminants of concern, collect the appropriate volume of soil.
2. Carefully place the appropriate volume of soil into the appropriate sample container in accordance with the laboratory quality systems manual and/or laboratory method SOPs. Clean threads of sample container before placing lid back on sample container to ensure tight seal. Secure lid tightly and complete sample label with ID, date, time, required analysis, etc.
3. Record the location, depth, and characteristics of the grab soil sample in the log book. Soil characteristics should be classified in accordance with **W&B SOP# FP-14**.
4. Complete the chain-of-custody record in accordance with **W&B SOP# FP-04**, ensuring that holding time and temperature preservation requirements are maintained.

**Composite Samples** – Composite samples are grab samples collected from pre-determined locations that are mixed in a container until uniform and placed into containers for submittal to the laboratory. The number of subsamples used to create a composite will be determined during work planning and based upon the volume of soil to be represented and the data quality objectives of the project; values can range from a minimum of 8 for small stockpile characterization up to 50 subsamples when a multi-increment sampling approach is employed.

Due to potential contaminant volatilization during mixing, this method is appropriate **ONLY** for samples submitted for non-volatile analyses. Soil samples may be collected using dedicated or reusable equipment. All reusable sample equipment must be decontaminated between sample locations in accordance with **W&B SOP# FP-06**.

1. Using the appropriate soil collection method and equipment based on the contaminants of concern, collect an equal grab sample from each area to be composited. Place each grab sample into a mixing container that is appropriate based on the contaminants of concern.
2. Gently mix the sample using a cone-and-quartering method until thoroughly homogenized. Multiple iterations should be performed until homogeneity can be visualized by grain size, color, moisture content, and cohesiveness.
3. Carefully place the appropriate volume of homogenized soil into the appropriate sample container in accordance with the laboratory quality systems manual and/or laboratory method SOPs. Clean the threads of the sample container before placing lid back on sample container to ensure tight seal. Secure lid tightly and complete sample label with ID, date, time, required analysis, etc.
4. Record the number, locations, and depths of the composited grab samples in the log book. Include a sketch of the sample area and location of the grab samples that comprise the composite.
5. Complete the chain-of-custody record in accordance with **W&B SOP# FP-04**, ensuring and that holding time and temperature preservation requirements are maintained.

## STANDARD OPERATING PROCEDURE

<b>Title:</b> Water Quality Monitoring Using a YSI Multi-Probe System (MPS)	<b>No:</b> FP-03	
<b>Approved:</b> R. Rooks	<b>Original Date:</b> 3/30/2017	<b>Revised:</b>

### Purpose:

To monitor basic water quality parameters including temperature, pH, oxidation-reduction potential (ORP), specific conductance, total dissolved solids (TDS), and dissolved oxygen (DO) in a uniform, efficient, and defensible manner using a YSI MPS.

### Equipment/Materials:

1. YSI MPS water quality meter with the necessary sensors installed
2. Specialized flow-through cell
3. Probe sensor guard
4. Peristaltic pump and power source
5. Dedicated polyethylene and silicon tubing

### Procedure:

All measurements (temperature, DO, pH, specific conductance, TDS, and ORP) can be taken simultaneously in the field by using the probe sensor guard and immersing the probe down-well or in a surface water body or by using the flow-through cell in conjunction with a peristaltic pump and required tubing.

### **Direct Data Collection**

1. Ensure the probe is properly decontaminated prior to immersing it in a dedicated monitoring point such as a monitoring well.
2. Attach the probe sensor guard.
3. Attach the probe cable to the YSI MPS display at the cable connector.
4. Turn on the instrument.
5. Locate the sampling point.
6. Carefully immerse the probe, with probe sensor guard attached, directly into the body of water that you wish to test.
7. Ensure that there are no air bubbles trapped in the sensors by gently rotating and/or moving the probe up and down. This is very important for accurate DO readings.
8. Keep the sensors in the water until the readings on the YSI MPS screen have stabilized.
9. Record the results on the field form or in the field log book.
10. Properly decontaminate the probe and return it to its protective case and secure it for transport to the next sampling site.

### **Data Collection Using the Flow-Through Cell**

1. Screw the probes into the top of the flow through cell.
2. Attach the probe cable to the YSI MPS at the cable connector.
3. Turn on the instrument.
4. Locate the sampling point.

5. Begin pumping water through the bottom entry port and into the flow-through cell using a peristaltic pump and appropriate tubing.
6. Insure that there are no air bubbles trapped in the sensors by rotating and/or moving the flow-through cell up and down. This is very important for accurate DO readings.
7. Allow the flow through cell to fill as slowly as possible. Once the cell is full and water begins exiting the top exit port, allow time for the readings on the YSI MPS display to stabilize.
8. Record the results on the field form or in the field log book.
9. Rinse the probes and return the meter to its protective case and secure it for transport to the next sampling site. Discard the sample water.

Additional considerations:

Samples for laboratory analysis should not be collected from the flow-through cell exit port unless the flow-through cell is dedicated to the sampling point. Effective decontamination of the flow-through cell in the field is not considered practical. When using the flow-through cell to assess stability of groundwater chemistry parameters during low-flow sampling, simply remove the cell prior to collecting samples from the pump tubing.

## STANDARD OPERATING PROCEDURE

<b>Title:</b> Sample Custody and QA/QC Sample Collection	<b>No:</b> FP-04
<b>Approved:</b> R. Rooks	<b>Original Date:</b> 3/30/2017 <b>Revised:</b>

### Purpose:

To ensure data quality by providing a clear record of sample custody from the sampling event through laboratory analysis, and by collecting appropriate QA/QC samples during the sampling event.

### Equipment/Materials:

1. Sample containers obtained, preserved, and handled as required for the specific media and analyses.
2. Analytical request/chain-of-custody form(s), sample label(s) and sample custody seal (if applicable).
3. Coolers or other container for transporting samples.
4. Writing implement - pen or marker only.

### Procedure:

#### **Sample Custody**

1. Before sampling, confer with the laboratory performing the analysis and review the chain-of-custody requirements as outlined in this SOP.
2. Obtain, preserve, and handle samples in accordance with laboratory method SOPs.
3. Sample containers may be pre-labeled or labeled immediately after collection.
4. Sample container labels must include:
  - Sample ID number/name. Sample identification names/numbers must be unique.
  - Site/project name.
  - Analysis required (EPA method number or laboratory analysis reference).
  - Sample type: composite or grab.
  - Date of sample collection.
  - Time of collection. Sample collection time(s) must be in 24-hour notation.
  - Sample preservation (if applicable).
  - Sampler names or initials.
5. Immediately before or after obtaining an individual sample set, begin filling out the analytical request/chain-of-custody record.
6. Fill out the sections on the chain-of-custody record regarding sample identification; sample collection time and date; analysis requested; comments; container/preservation; matrix; and other field measurements by checking the boxes and adding any comments as

appropriate. It is not necessary to include sample collection time on the field duplicate sample.

7. Verify that the chain-of-custody is complete with all samples accounted for and properly identified before finalizing the sampling event. Samples must be accompanied by the completed chain-of-custody at all times during transport.
8. Sample custody seals are required when specified in the work plan or Quality Assurance Project Plan (QAPP). The level of control can vary; seals can be placed on each individual sample or on the sample cooler/other container used for transporting samples. Verify with the project manager prior to sample collection.
9. Sample custody seals are to be placed over the cap and container of an individual sample or over the lid and body of the container/cooler so that a broken seal provides evidence of tampering. Custody seals must be signed and dated.
10. As required by analytical method SOPs specified in laboratory requirements, the samples should be placed in a cooler with enough ice to maintain the required temperature preservation. Samples should not be submersed in water and should be kept from freezing.
11. Samples should be packed in the cooler/container in a way that prevents breakage or the leaking of melted ice water or the leaking of damages containers.
12. The chain-of-custody document is two pages of carbonless copy paper. The yellow copy (bottom) should be retained by the sampler and the white copy (top) should be retained by the laboratory. When shipping samples via courier, the laboratory copy of the chain-of-custody should be transported with the samples in the cooler/container (within a plastic protective cover/bag) or secured to the exterior of the cooler/container in a packing slip pocket.
13. Upon completion of the sampling event, transport the samples to the laboratory for analysis. If the samples are delivered to the lab by the same individual(s) who performed the sampling, the sampler is responsible for maintaining the record until the samples are delivered to the lab. If transferring the samples to a different individual for delivery, the sampler must sign on the lower block on the second page under "Samples Relinquished By." The person transporting the samples to the lab must sign on the lower block under "Samples Received By," and fill in the correct date and time in the spaces provided. If the samples are shipped via commercial carrier to the lab, the sampler must sign in the lower block on the second page under "Samples Relinquished By," and fill in the date and time in the space provided. The sampler also places the name of the commercial carrier under "Samples Received By" and retains the carrier's shipping receipt as evidence. The sampler then places the chain-of-custody record within or secured to the sample carrier (usually a cooler).
14. Upon arrival at the laboratory, deliver the samples to the individual responsible for sample receipt.
15. Sign the chain-of-custody record on the lower block on the second page under "Samples Relinquished By."
16. Ensure that the laboratory representative signs the record on the lower block on the second page under "Samples Received By," and places the correct date and time in the spaces provided.

17. If the samples must be transferred for any reason (e.g., to another laboratory or section for specialized analyses, etc.), instruct the laboratory representative to follow the above procedure to fill out additional custody documentation.
18. Ensure that the laboratory returns the properly completed chain-of-custody record and file it with the laboratory results.

### **Common QA/QC Sample Types and Collection**

QA/QC requirements will vary and will be detailed in the work plan, site-specific QAPP, or other documents.

1. **Field Duplicate** - Two sets of samples are obtained from the same media and sampling location and are analyzed using the same laboratory method. The location of the field duplicate sample will not be identified on the chain-of-custody record. Field duplicates should be collected from a location immediately adjacent to (spatial), immediately in succession to (temporal), or as a homogenized split of the true sample. The duplicate sample tests the precision of the laboratory analytical method, as well as the quality of the field sampling methods.
2. **Equipment Blank**- An aqueous sample is collected from deionized water that is rinsed over or throughout the equipment after decontamination and before sampling. This sample documents proper decontamination procedures. An equipment blank is not necessary when dedicated sample equipment is utilized.
3. **Field Blank/Trip Blank**- Aqueous trip blanks will consist of deionized water collected in the same lot of containers used in the sampling event, and will be preserved in the same manner. Soil/solid trip blanks will consist of a methanol-preserved (same as sample event) VOA. The trip blank samples will travel with the other sample containers from that sample event. Generally, one trip blank is required per sample event; however, scope and work plans may vary. This sample documents proper transport, handling and storage procedures and verifies container cleanliness.
4. **Bottle Blank**- Deionized water is added to an empty container from the same lot of containers as the sampling event. A bottle blank is not usually necessary when using containers that were pre-cleaned at the laboratory or factory prior to shipment. This blank may also be combined with a trip blank analysis.
5. **Temperature Blank**- Deionized water is collected at the laboratory or prior to the initiation of field work, and is transported with the other samples to the sampling site and back to the laboratory to document the temperature (preservation) of the samples in the container/cooler.

Sample collection and documentation will conform to the following standard(s) as applicable:

*ASTM D4840 - 99(2010) Standard Guide for Sampling Chain-of-Custody Procedures.*

## STANDARD OPERATING PROCEDURE

<b>Title:</b>	Cleaning/Decontamination Procedures	<b>No:</b>	<b>FP-06</b>
<b>Approved:</b>	R. Rooks	<b>Original Date:</b>	4/5/2017
<b>Revised:</b>			

Purpose:

To minimize the spread of contamination within a specific study area as well as from site to site, to reduce the potential for worker exposure through contact with potentially contaminated equipment and, to improve data quality and reliability.

Equipment/Materials:

1. Detergent – non-phosphate detergent solution (Alconox<sup>®</sup> or Liquinox<sup>®</sup>)
2. Clean control rinse water – preferably from a water system of known chemical composition
3. Deionized water – organic-free reagent grade
4. Appropriate clothing, gloves, eye protection
5. Field log book or project check list

Procedure:

Depending on site conditions, it may be desirable to perform all equipment decontamination at a centralized location on site. If this is the case, care must be taken to transport the equipment to the decontamination area such that the spread of contamination is minimized. During decontamination activities, appropriate clothing, gloves and eye protection should be worn at all times.

**For Equipment in Contact with Environmental Media**

Before and after sample collection, decontaminate any reusable equipment that has contacted or will contact the environmental media to be sampled. More rigorous or alternate decontamination procedures may be employed if necessary to meet specific sampling or QA/QC objectives.

1. Rinse the equipment thoroughly with clean water. Brush to remove all visible material.
2. Wash the equipment with a solution of Alconox<sup>®</sup> or Liquinox<sup>®</sup> and clean control water. A brush should be used to remove inert substances from equipment. For equipment that, because of its internal mechanism, cannot be adequately cleaned with a brush, ensure that the decontamination solutions are adequately flushed or circulated through the equipment.
3. Rinse the equipment thoroughly with clean control water.
4. Rinse the equipment with deionized water.
5. Place on a clean surface to air dry or wrap in aluminum foil to preserve cleanliness before next use.

## STANDARD OPERATING PROCEDURE

<b>Title:</b>	Sampling Groundwater for Volatile Organic Compounds (VOCs), Volatile Petroleum Hydrocarbons (VPH), and Extractable Petroleum Hydrocarbons (EPH)	<b>No:</b> <b>FP-07</b>
<b>Approved:</b>	R. Rooks	<b>Original Date:</b> 7/6/2010
		<b>Revised:</b> 3/30/2017

Purpose:

To ensure that accurate, legally defensible, and representative data is collected when collecting groundwater samples for VOC, VPH, and EPH analyses.

Equipment/Materials:

1. Water-level indicator or oil/water interface probe
2. Peristaltic pump and power source
3. YSI Multi-Probe System
4. Bailers (based on project and site conditions)
5. Sample tubing (based on project, site conditions, and contaminants of concern)
6. Pre-cleaned, laboratory-supplied sampling containers
7. Coolers/packing materials/wet ice
8. Field log book or project check list

Procedure:

Groundwater samples may be collected using conventional (standard) techniques or via low-flow techniques depending upon project objectives and data needs. Users are responsible for selecting the appropriate technique and adhering to the protocols outlined below.

**STANDARD PURGING AND SAMPLE COLLECTION:**

1. Measure depth to static water level and depth to bottom of well.
2. Calculate standing water volume in the well.
3. Using a new or decontaminated bailer, purge either: (1) five well volumes of water from the well, (2) until the well is dry, or (3) until pH, specific conductance and temperature readings stabilize.
4. Transfer the sample directly from the bailer into the appropriate sample container(s).
  - a) VPH and VOC samples – three pre-cleaned, pre-preserved 40-milliliter VOA vials with Teflon septa caps.
  - b) EPH samples - two pre-cleaned 1-liter amber bottles equipped with Teflon-lined screw caps.
5. Pre-preserved sample containers provided by the laboratory are to be used whenever possible. Care must be taken to ensure that the preservative (hydrochloric acid) is not

spilled during filling of containers. Sample pH of  $<2$  must be maintained, and can be accomplished by adding 3 to 4 drops of HCl to a 40-ml VOA vial when needed.

6. After filling vials for VOC or VPH samples, invert each vial and tap to liberate potential air bubbles. Inspect to ensure no air bubbles are in the vial.
7. Place samples on ice immediately. Keep refrigerated until delivery to laboratory under chain-of-custody. Samples must be maintained at a temperature of less than  $6^{\circ}\text{C}$  but not frozen.

### **LOW FLOW PURGING AND SAMPLE COLLECTION (Less than 25 ft to water):**

1. Measure depth to static water level and depth to bottom of well.
2. Determine desired sample intake depth based on well construction log and carefully install decontaminated or new/unused sampling tubing and foot valve assembly, minimizing disturbance of the water column:
  - a) Set the intake near the top of the well screen for surficial groundwater monitoring wells; or
  - b) Set the intake at the center of the screened interval for vertical delineation groundwater monitoring wells.
3. Attach the sampling tubing to clean, unused peristaltic pump tubing using appropriately sized vacuum fittings (male-male hose barb connection or similar fitting).
4. Attach the discharge of the pump to a calibrated flow-through meter capable of measuring, at a minimum, pH, temperature, and specific conductance, and at least one additional parameter such as oxidation-reduction potential, dissolved oxygen, and/or turbidity.
5. Initiate pumping at the lowest possible flow rate and monitor water level drawdown in the well while gradually increasing flow rate. Set the flow rate at the point just before water level drawdown occurs (generally less than 0.5 liter per minute or 0.12 gallons per minute).
6. Observe and record field parameters and water level drawdown initially at 5 to 15 minute intervals. Once stabilization appears to be approaching, increase the observation frequency to every 3 to 5 minutes. Purging is complete when three successive measurements meet the following minimum criteria:
  - $\text{pH} \pm 0.1$
  - Specific Conductivity  $\pm 0.3\%$
  - Dissolved Oxygen  $\pm 10\%$

If additional parameters are considered, recommended stabilized tolerances are:

- Reduction-Oxidation Potential  $\pm 10 \text{ mV}$
  - Turbidity  $\pm 10\%$
7. Disconnect the flow-through field parameter meter and collect the sample from the pump discharge tubing.

8. Fill the sample containers directly from the pump discharge tubing, following the same procedures outline in steps 4 through 7 of Standard Purging and Sample Collection above.

### **DECONTAMINATION:**

Use of disposable sampling equipment is preferred. However, if any item of equipment will be introduced into more than one well in a sampling round, the wells should be gauged and/or sampled in order of increasing contamination (*i.e.* wells anticipated to be less contaminated will be sampled first). After use in each well, the equipment will be decontaminated using, at a minimum, the following sequence:

1. Rinse with clean water
2. Wash with Alconox (laboratory detergent) and clean water solution
3. Three rinses with clean water
4. Rinse with distilled water

Similar decontamination procedures should be followed for all equipment introduced into the well, including water level meters, interface probes, and intake tubing. Bailers exposed to free product will not be re-used to sample for dissolved volatile constituents.

## STANDARD OPERATING PROCEDURE

<b>Title:</b>	Field Measurement of Turbidity	<b>No:</b>	FP-09
<b>Approved:</b>	R. Rooks	<b>Original Date:</b>	4/6/2017
<b>Revised:</b>			

Purpose:

To provide guidance on measuring turbidity in aqueous samples in the field.

Introduction:

The turbidity meter measures the scattering effect that suspended solids have on the propagation of light through a body of water (surface or ground waters). The higher the effect (i.e., intensity of scattered light), the higher the turbidity value. Suspended and colloidal matter such as clay, silt, finely divided organic and inorganic matter, and plankton and other microscopic organisms cause turbidity in water.

Equipment/Materials:

1. Turbidimeter (nephelometer) or a spectrophotometer consisting of a light source and one or more photoelectric detectors with a readout device to indicate the intensity of light.
2. Clean sample cells or tubes of clear glass or plastic

Procedure:

1. Properly calibrate the instrument prior to use using the manufacturer’s instructions, or document that the instrument has been calibrated.
2. Collect an aqueous sample in an intermediate container.
3. Gently agitate the sample and wait until air bubbles disappear.
4. Double-rinse the sample cell with a small amount of the sample. Discard rinse water and pour an aliquot into the sample cell.
5. Gently dry its external surface with lint-free paper.
6. Insert the cell in the instrument and read the turbidity directly from the meter display.
7. Do not use vacuum degassing, ultrasonic bath, or other devices to remove bubbles from the sample. If the sample contains visible bubbles or if it effervesces (as in groundwater, with changes in pressure and temperature), make a note of this in the field records and collect a sample for laboratory measurement.
8. If effervescing samples are collected for laboratory analysis collect the sample in a 250mL polyethylene bottle without leaving headspace in the container, and ship it as soon as possible to the laboratory (the holding time for this measurement is only 48 hours). Ship this sample in wet ice at 6 degrees Celsius.
9. Pour out the sample, double-rinse the sample cell with de-ionized water prior to the next sample.
10. Record results and observations in the field log book.

## STANDARD OPERATING PROCEDURE

<b>Title:</b> Measuring Liquid Levels in Monitoring Wells	<b>No:</b> FP-11
<b>Approved:</b> R. Rooks	<b>Original Date:</b> 4/5/2017
<b>Revised:</b> 10/13/2017	

### Purpose:

To ensure representative well gauging data are uniformly collected and can be used to determine depth to light non-aqueous phase liquid (LNAPL) and/or water within a monitoring well, apparent LNAPL thickness, and/or groundwater elevations.

### Equipment/Materials:

1. Water level indicator (WLI) or interface probe (I-probe)
2. Spray bottle with deionized (DI) water
3. Spray bottle with non-phosphate detergent solution
4. Paper towels
5. Field log book or project check list

### Procedure:

1. Locate wells. Begin measurements at the least contaminated well (if known), progressing to the most contaminated well.
2. Before opening the well, note and record the condition of well casing & protective cover.
3. Open well cap, turn on the WLI/I-Probe, and slowly lower the probe down the well until the WLI/I-Probe probe is activated. Find the liquid surface using the signals listed below.
  - a. WLI – water level is signaled by a solid steady tone and green light.
  - b. I-Probe – LNAPL level is signaled by a solid steady tone and steady light, and water level is signaled by an intermittent tone and flashing light
4. Make a depth-to-LNAPL and/or water measurement from the top of the well casing (a measuring point on the well casing may be pre-marked). Measurements should be taken using the measuring tape attached to the probe. Note any visual observations or odors associated with the groundwater. Record results in field notes.
5. For LNAPL, take the air/product interface measurement on the way into the liquid, and the water/product interface on the way up. When passing through the product into water, some product may adhere to the probe sensor due to surface tension. Therefore, when water is detected below product, the probe should be raised and lowered rapidly in a short vertical motion to remove any product that may have been carried down with the probe.
6. If not already known, make a depth-to-bottom measurement (to the nearest 0.01 foot  $\pm$ ) of the well from the same location on the top of the well casing. Record results in field notes.
7. If necessary, calculate apparent LNAPL thickness, which is the difference between the LNAPL level measurement and the water level measurement. Record results in field notes.
8. Replace well cover/cap.
9. Properly decontaminate the probe between well locations in accordance with **W&B SOP# FP-06**.

Additional Considerations:

1. Use a dedicated WLI to gauge water supply wells, and do not use this WLI in known contaminated or potentially contaminated monitoring wells.
2. Refer to product owner's manual for troubleshooting and maintenance procedures.

**STANDARD OPERATING PROCEDURE**

<b>Title:</b> Soil Logging and Description	<b>No:</b> FP-14
<b>Approved:</b> R. Rooks	<b>Original Date:</b> 9/7/12
<b>Revised:</b> 4/1/17	

Purpose:

To ensure that soils observed during field work are classified in a uniform, accurate, and legally-defensible manner using a modified form of the Burmister System of soil classification.

Introduction:

Soil classification is based upon visual observation and simple manual tests that can be conducted in the field. Wilcox & Barton, Inc. uses a modified form of the Burmister System of soil classification to describe soil samples during surface and subsurface investigation activities. The modified system allows for rapid evaluation of soil type in the field to produce a description that is easy to understand and reproduce for both geological and engineering applications. A proper modified Burmister soil description includes the following eight components, listed in this exact order:

1	2	3	4	5	6	7	8
Density or consistency	Apparent color	MAJOR component	Proportional adjective	Minor Component	Other adjective	Apparent moisture	Origin

Observations are recorded in a bound field notebook or on a soil logging template created specifically for this purpose. Soil should be described to a level of detail that matches the use and intent of the data. For example, if one-inch layers within a stratified deposit are repeated, then the entire unit can be described as alternating layers of material. If, however, a small layer is significant in terms of site hydrogeology, such as a potential contaminant pathway or confining layer, it must be described as such on the appropriate scale.

The Burmister classification was developed based on gradational characteristics of cohesionless soils and the plasticity behavior characteristics for cohesive soils. The term "cohesionless" normally applies to materials larger than and including silt-sized particles; however, some silt materials exhibit "apparent cohesion" and may therefore be described as cohesive. For samples in which both cohesionless and cohesive soils are present, the density or consistency descriptor should apply to the major soil component.

Equipment/Materials:

1. Equipment typically used during subsurface investigations that allow for visual inspection of the soil (excavator or backhoe; drill rig; hand auger; shovel).
2. Field log or field data sheet

Procedure:

Soil classification is based upon visual observation and simple manual tests that can be conducted in the field. Wilcox & Barton, Inc. uses a modified form of the Burmister System of soil classification to describe soil samples during surface and subsurface investigation activities. The modified system allows for rapid evaluation of soil type in the field to produce a description that is easy to understand and reproduce for both geological and engineering applications. A proper modified Burmister soil description includes the following eight components, listed in this exact order:

1	2	3	4	5	6	7	8
Density or consistency	Apparent color	MAJOR component	Proportional adjective	Minor Component	Other adjective	Apparent moisture	Origin

Observations are recorded in a bound field notebook or on a soil logging template created specifically for this purpose. Soil should be described to a level of detail that matches the use and intent of the data. For example, if one-inch layers within a stratified deposit are repeated, then the entire unit can be described as alternating layers of material. If, however, a small layer is significant in terms of site hydrogeology, such as a potential contaminant pathway or confining layer, it must be described as such on the appropriate scale.

The Burmister classification was developed based on gradational characteristics of cohesionless soils and the plasticity behavior characteristics for cohesive soils. The term "cohesionless" normally applies to materials larger than and including silt-sized particles; however, some silt materials exhibit "apparent cohesion" and may therefore be described as cohesive. For samples in which both cohesionless and cohesive soils are present, the density or consistency descriptor should apply to the major soil component.

**1. Density or Consistency**

The density or consistency of a soil material always refers to its in-place, undisturbed condition. This terminology is a measure of soil density or strength and can be evaluated for both cohesive and cohesionless soils.

Density or consistency is typically based on the number of blows required to advance a split spoon sampler in accordance with ASTM D-1586 specifications for the Standard Penetration Test. The summation of the blows necessary to drive the second and third 6-inch increments of penetration during sample recovery is called the Standard Penetration Number (N-value). The N-value is then compared to the ranges below to determine the density or consistency:

Non-Cohesive Soils	
N-value	Density Description
0-4	Very loose
4-10	Loose
10-30	Medium dense
30-50	Dense
>50	Very dense

Cohesive Soils	
N-value	Density Description
0-2	Very soft
2-4	Soft
4-8	Medium stiff
8-15	Stiff
15-30	Very stiff
>30	Hard

When collecting samples by hand or by Direct Push methods without N-value information, an estimate of density may be made based on the judgment of the individual collecting the sample. A note should be included on the sample log indicating that the recorded density is estimated.

**2. Apparent Color**

Colors are described using basic colors or combinations of colors such as “dark gray”, “gray-brown”, “reddish-brown” or “brown and tan”. Since color interpretation is subjective, the intent is to note the general identifying color of the major constituent to best designate a particular stratum or soil condition. Color charts may be used if necessary to better judge subtle changes in color. The color should be described shortly after collection while the material is still in its natural field moisture condition because color shade is subject to change during drying.

**3. MAJOR Component**

The first step in soil type classification is to identify the major constituent of the soil and to estimate, on a visual basis, the relative percent of its composition. The major component is recorded in capital letters. An estimate of the relative percent composition should be made, and should generally be greater than 30 to 50 % in order for the component to be predominant (see also Field References at the end of the document). Identification of the MAJOR (and minor) components is made according to particle size in accordance with the Unified Soil Classification System (USCS) classifications:

Particle Size			
	millimeters	inches	Sieve size
Boulder	>300	>12	--
Cobble	75 to 300	3 to 12	--
Gravel	4.75 to 75	3/16 to 3	No. 4 to No. 3
Coarse SAND	2.0 to 4.75	0.08 to 3/16	No. 10 to No. 4
Medium SAND	0.43 to 2.0	0.02 to 0.08	No. 40 to No. 10
Fine SAND	0.08 to 0.43	0.003 to 0.02	No. 200 to No. 40
SILT and CLAY	<0.075	<0.003	< No. 200

Because boulders, cobbles and some gravel are not recovered in a split spoon, percentages cannot be accurately determined from the standard penetration test. Instead, the possible presence of these constituents may be evaluated based on drilling behavior (*i.e.*, grinding or “jumping” of the drill bit or refusal of the split-spoon) or by observation of soil cuttings and noted on the boring log. The possible presence of these larger particles should be included under the sample description portion of the log. A description of the manner in which large particle presence was identified (*e.g.*, based on drill stem behavior) should be included in the general notes. If gravel, cobbles and boulders are observed during other investigations such as test pit excavation, the proportions may be listed in percentages or, because of potential difficulty in estimating volumetric proportions of larger particles based on visual examination, it is acceptable to simply reference their presence. When boulders are observed, a note should be made regarding their relative size.

For cohesive soil, a second descriptive adjective should be used that further defines the character of the fine particles (those passing a No. 200 sieve). These descriptions are based upon simple field tests conducted on representative samples of the material. The most effective field test is for plasticity, which is the resistance of the soil to crumbling at decreasing water contents. Soil is rolled between the hands into the smallest possible thread until the thread breaks apart. At the

point where the thread breaks, the diameter is noted and compared to the associated descriptions below.

Description	Smallest Rolled Diameter (inches)	Overall Plasticity
SILT	based on texture, not roll diameter	Nonplastic
Clayey SILT	1/4	Slight
SILT & CLAY	1/8	Low
CLAY & SILT	1/16	Medium
Silty CLAY	1/32	High
CLAY	1/64	Very high

#### 4. Proportional Adjective

The minor soil constituent types are identified along with the corresponding percent composition of the sample. The soil type is identified based upon particle size as described above. The proportions of the minor components are described with an adjective based upon the visually estimated percentage (see Field References) of the minor components as presented below:

Percent Composition	Descriptive Adjective
1-10	Trace
10-20	Little
20-35	Some
35-50	And

Minor constituents are recorded following the major constituent in order of decreasing proportion and the first letter in each minor constituent is capitalized. For example:

- A sample consisting of 40% fine sand, 25% medium sand, 20% coarse sand and 15% gravel would be described as **fine SAND, some medium to coarse Sand, little Gravel.**
- A sample consisting of 50% fine sand, 30% medium sand and 20% clayey silt would be described as **fine SAND, some medium Sand, some Clayey Silt.**
- A sample consisting of 60% clay and silt, 30% coarse sand and 10% gravel could be described as **CLAY & SILT, some coarse Sand, trace Gravel.**

#### 5. Minor Component

The minor component is identified in the same manner as the MAJOR component based on particle size.

#### 6. Other Adjective(s) and Descriptions

Following the description of the minor components, other useful information can be reported such as descriptions of soil structure (*e.g.*, angular grains, cemented, blocky), formation characteristics (*e.g.*, stratified, mottled, lenses, clasts), and other characteristics observed (*e.g.*, organic matter, debris, cobbles and boulders). The descriptions should be brief and pertinent to the investigation. Odors and visible staining should be noted. Whenever an odor is noted, a description of the strength and type should be provided (*e.g.*, strong, mild, gasoline-like, diesel-like, sewage, sulfur).

## 7. Apparent Moisture

Following the soil description, an estimate of the moisture content should be selected based on the following conditions. When saturated soil is noted, the logs should reflect that the apparent depth of the water table has been reached.

Description	Condition
Dry	No apparent moisture, soil can be blown away (no adhesion).
Damp	Color change noted, soil cannot be blown away (some adhesion).
Moist	Moisture apparent, soil can be packed.
Wet	Free moisture apparent, water can be squeezed or shaken from the sample, water observed in the sample container.

## 8. Soil Origin

As a final, general description of the soil, a note may be added that indicates a known geologic soil formation. This may include referencing the material as Fill, Glacial Till, Glacial Outwash, Peat, Lacustrine Deposit, etc.

In addition to the general geologic description, the USCS symbol may also be required for certain projects. The USCS symbol should be capitalized and correspond to the Modified Burmister description given to the soil. A USCS Classification Chart is provided in the Field References below.

## STANDARD OPERATING PROCEDURE

<b>Title:</b>	Groundwater Sampling for Per- and Polyfluoroalkyl Substances (PFAS)	<b>No:</b>	FP-17
<b>Approved:</b>	R. Rooks	<b>Original Date:</b>	4/14/17
		<b>Revised:</b>	

### Purpose:

To provide guidance on proper collection of groundwater samples that will be analyzed for Per- and Polyfluoroalkyl substances (PFAS).

### Introduction:

PFAS are a large group of man-made fluorine-containing chemicals with unique properties to make materials to which they are applied stain and stick-resistant. Chemicals in this group have been used in many industries, including aerospace, automotive, construction, manufacturing, electronic, and textile. PFAS have been used since the 1940s as manufacturer-applied oil and water repellants on products such as clothing, upholstery, paper, and carpets, and were also used in making fluoropolymers for non-stick cookware. PFAS have also been used as mist suppressants that can be added to metal plating baths, to prevent air releases, and to firefighting foams used on fires involving flammable liquids.

EPA has established a Drinking Water Health Advisory Level of 70 parts per trillion (ppt, or 0.070 ppb), which is an order of magnitude lower than typical analytes at typical release sites. State-specific limits can be lower. Therefore, preparation and sampling technique are of critical importance to avoid cross- and background contamination. Further, much of our normal sampling equipment contains Teflon and other fluoropolymer materials (e.g., Teflon tubing, Teflon-lined container caps). Tyvek contains PFAS, as do Sharpies, waterproof field logbooks, cosmetics, moisturizers and sunscreens, fabric softener, aluminum foil, Post-it notes, and fast food wrappers. Such materials should not be present at the project site or contacted on the day of the planned sampling event, as discussed further below. Maintain separate coolers for PFAS sampling and do not store PFAS sample containers with other typical containers/glassware.

The mechanical process of groundwater sample collection is the same as sampling groundwater for volatile organics. The key and most important distinction is an ultra-high level of diligence to prevent cross-contamination and background contamination. Read this protocol in its entirety before preparing for a sampling event.

### Equipment/Materials\*:

1. Water-level indicator or oil/water interface probe.
2. Peristaltic pump and power source.
3. YSI Multi-Probe System.
4. High density polyethylene or silicone tubing (no Teflon) – shall be dedicated for each sampling event and disposable.
5. Bailers (HDPE, no Teflon) – shall be dedicated for each sampling event and disposable
6. Pre-cleaned, laboratory-supplied sampling containers in individual Ziploc bags. The laboratory will send multiple 250-mL polypropylene bottles with wide-mouth screw caps

for each sample location. If sampling groundwater or non-potable water, the bottles will be unpreserved.

7. Loose-leaf note paper for field notes (e.g., project checklist). Waterproof field books shall not be used.
8. Coolers/packing materials/wet ice (no Blu-Ice or chemical packs of any kind).
9. Ball point pen or pencil and metal or Masonite clipboard.

\* Materials that are not allowed, per the above, shall not be present on the project site. Where prohibited items are part of routine sampling gear, they should be left inside the field vehicle and not contacted or handled by the field sampler prior to PFAS sample collection.

### Sample Collection:

Actual collection of samples in the field shall be performed using low-flow techniques in accordance with *SOP# FP-07* or via bailer in accordance with *SOP# FP-08*. Analytical method SW-846 Method 537 should be specified on the chain of custody.

### Duplicates and Blanks:

- Trip Blanks: At least one laboratory-prepared trip blank shall accompany each cooler of samples submitted for PFAS analysis.
- Equipment Blanks: At least one equipment blank shall be collected for each type of equipment for which decontamination is performed. In addition, one equipment blank shall be collected from a representative item of new (unused) equipment (e.g., sample tubing, bailer). Laboratory-supplied reagent-free water shall be used for development of all equipment blanks.
- Field Blanks: At least one field blank shall be collected during each sampling event. The field blank should be prepared by the sampler at the time and site of sample collection using the procedure below, **prior to** collecting any field samples.
  - Open the bottle labeled “reagent free water.” Transfer the reagent free water by pouring it into the bottle labeled “Field Blank,” then seal it. This is to assess whether contamination occurs during sample collection. The field blank and the empty bottle should be shipped back to the laboratory with the field samples.
- Duplicates: At least one blind replicate or field split shall be collected for each environmental medium sampled. Duplicates should be collected for each drinking water sample submitted, but held at the laboratory for analysis only if PFAS are detected in the original sample. Sample HOLD must be clearly indicated on the chain of custody.

### Field Clothing and Personal Protective Equipment:

1. Do not wear water resistant, waterproof, or stain-treated clothing. Synthetic and natural fibers are acceptable. Field clothing must be laundered without the use of fabric softener, and washed at least six times from the time of purchase before use in the field. Do not wear new clothing while sampling.
2. Do not wear clothing or boots containing Gore-Tex or treated with DWR (Durable Water Resistant) coating. All safety footwear shall consist of steel-toed boots made with polyurethane or PVC.

3. Do not wear Tyvek clothing.
4. Disposable nitrile gloves must be worn at all times. Gloves should be changed frequently throughout the sampling operation. Anytime a distinct operation changes, such as between well purging and sample collection, a new pair of gloves should be donned.

#### Sample Containers:

1. Groundwater samples shall be collected in 250 mL polypropylene or HDPE bottles fitted with an unlined (no Teflon), polypropylene, or HDPE, wide-mouth screw cap. This requirement MUST be specified when ordering sampling supplies from the laboratory.
2. Container labels shall be completed using pen (no markers) after the caps have been placed back on each bottle.
3. Each sample should be placed into an individual, fully-sealed, Ziploc bag and placed in a cooler packed only with ice (wet ice only, no chemical packs).
4. PFAS samples should be placed in a dedicated cooler separate from all other non-PFAS samples.
5. Glass containers shall not be used due to potential loss of analyte through adsorption.

#### Wet Weather:

Field sampling during wet weather should be conducted while wearing appropriate clothing that will not pose a risk for cross contamination. Rain gear shall be made from polyurethane and wax-coated or oil-cloth materials. Treated textiles shall not be used.

#### Decontamination:

1. Re-usable equipment, including depth-to-water and oil/water interface meters, shall be decontaminated between measurement points (*i.e.*, wells).
2. Alconox and Liquinox soaps are acceptable. Decon-90 must not be used.
3. Water used for decontamination shall be laboratory-certified PFC-free. Standard de-ionized water shall not be used.
4. Decontamination shall follow the steps outlined in *SOP# FP-06*.

#### Personal Hygiene:

1. Field personnel may not use cosmetics, moisturizers, hand cream, or other related products as part of their personal cleaning/showering routine on the morning of the sampling event.
2. Sunblock and insect repellants, if used, should consist of 100% natural ingredients. Many manufactured products contain PFAS and are not to be brought to the project site.
3. No food or drink shall be brought on site, with the exception of bottled water and hydration drinks. Food for lunch, preferably from home, can be left in the field vehicle and consumed outside the work area.
4. Field personnel shall not have physical contact with fast food containers or wrappers on the day of the sampling event prior to sampling.

#### Sampling of Other Media:

When project plans require analysis of soil, sediment, or other non-aqueous media for PFAS, project teams should be aware that there are no established laboratory protocols at this time. However, it is possible that extraction techniques will be developed so that these matrices can be analyzed using EPA Method 537. The Project Manager shall contact the laboratory during the planning stage for sampling all environmental media for PFAS. In general, sample collection will be like normal, subject to the cross-contamination and sample container requirements outline above.

#### Documentation and Communication

Please note that you have followed PFAS sampling protocols in your field notes along with the weather. If a possible source of cross-contamination is discovered or recalled during or following sampling, please advise the Project Manager so that samples can be re-collected and/or data can be properly evaluated. Reference adherence to standard operating procedure FP-17 in the field notes.

**APPENDIX C**  
**Soil Descriptions**

**Summary of Soil Descriptions**  
 375 Banfield Road, Portsmouth, New Hampshire  
 Tax Map 266, Lot 7

BORING	PEN/REC (feet)	DEPTH (feet)	DESCRIPTION
C-1	2/2	0-2	0-2 ft bgs: Brown, FM SAND, some Gravel, some crushed rock 0.75-1.5', some Asphalt, some Brick, dry.
B-2	1.6/2	0-2	0-0.5 ft bgs: Asphalt/aggregate.
			0.5-2 ft bgs: Brown, FM SAND and SILT, little Gravel, damp.
A-1	2/2	0-2	0-2 ft bgs: Brown, FM SAND and SILT, little Gravel, damp, dense.
B-4	2/2	0-2	0-2 ft bgs: Brown, FM SAND and SILT, little Gravel and Rock Fill
C-3	1.5/2	0-2	0-2 ft bgs: Brown, FM SAND, some Gravel, some Silt. Dry.

Field Blank	21H1431-12	Ground Water		SOP-454 PFAS	
Trip Blank	21H1431-13	Ground Water		SOP-454 PFAS	
Equipment Blank	21H1431-14	Ground Water		SOP-454 PFAS	

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

REVISION: 9/22/2021 client would like J flags added

**SOP-454 PFAS**

**Qualifications:**

**E**

Reported result is estimated. Value reported over verified calibration range.

**Analyte & Samples(s) Qualified:**

**Perfluorooctanesulfonic acid (PFO):**

21H1431-01[MW-1]

**PF-17**

Extracted Internal Standard recovery is outside of control limits. Data is not significantly affected since associated analyte is not detected and bias is on the high side.

**Analyte & Samples(s) Qualified:**

**M2-6:2FTS**

21H1431-09[MW-203]

**M2-8:2FTS**

21H1431-09[MW-203]

**PF-18**

Duplicate analysis confirmed Extracted Internal Standard failure due to matrix effects.

**Analyte & Samples(s) Qualified:**

**M2-6:2FTS**

21H1431-01[MW-1], 21H1431-01RE1[MW-1]

**M2-8:2FTS**

21H1431-01[MW-1], 21H1431-01RE1[MW-1]

**S-29**

Extracted Internal Standard is outside of control limits.

**Analyte & Samples(s) Qualified:**

**M2-4:2FTS**

21H1431-01[MW-1]

**MPFBA**

21H1431-01[MW-1]

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

39 Spruce Street \* East Longmeadow, MA 01028 \* FAX 413/525-6405 \* TEL. 413/525-2332

Project Location: 375 Banfield Rd., Portsmouth, NH      Sample Description:

Work Order: 21H1431

Date Received: 8/26/2021

Field Sample #: Equipment Blank

Sampled: 8/26/2021 09:10

Sample ID: 21H1431-14

Sample Matrix: Ground Water

## Semivolatile Organic Compounds by - LC/MS-MS

Analyte	Results	RL	DL	Units	Dilution	Flag/Qual	Method	Date Prepared	Date/Time Analyzed	Analyst
Perfluorobutanoic acid (PFBA)	ND	2.1	0.76	ng/L	1	U	SOP-454 PFAS	9/7/21	9/16/21 2:04	JFC

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
D	Sample analyzed at a dilution.
E	Reported result is estimated. Value reported over verified calibration range.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
PF-17	Extracted Internal Standard recovery is outside of control limits. Data is not significantly affected since associated analyte is not detected and bias is on the high side.
PF-18	Duplicate analysis confirmed Extracted Internal Standard failure due to matrix effects.
S-29	Extracted Internal Standard is outside of control limits.
U	Analyte included in the analysis, but not detected

REPORT DATE: 9/3/2021

PURCHASE ORDER NUMBER:

PROJECT NUMBER: BANF0004

**ANALYTICAL SUMMARY**

WORK ORDER NUMBER: 21H1487

The results of analyses performed on the following samples submitted to CON-TEST, a Pace Analytical Laboratory, are found in this report.

PROJECT LOCATION: 375 Banfield Rd, Portsmouth, NH

FIELD SAMPLE #	LAB ID:	MATRIX	SAMPLE DESCRIPTION	TEST	SUB LAB
MW-101	21H1487-01	Ground Water		SW-846 6020B SW-846 7470A SW-846 8270D-E	
MW-102	21H1487-02	Ground Water		SW-846 6020B SW-846 7470A	
MW-104	21H1487-03	Ground Water		SW-846 6020B SW-846 7470A	

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

For method 8270E, only PAHs were requested and reported.

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
U	Analyte included in the analysis, but not detected

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

**SW-846 6010D**

**Qualifications:**

**MS-19**

Sample to spike ratio is greater than or equal to 4:1. Spiked amount is not representative of the native amount in the sample. Appropriate or meaningful recoveries cannot be calculated.

**Analyte & Samples(s) Qualified:**

**Lead**

2110542-01[C-1 (0'-2')], 2110542-37[D-9 (0'-2')], B290266-MS1, B290267-MS1

**R-02**

Duplicate RPD is outside of control limits. Outlier can be attributed to sample non-homogeneity encountered during sample prep.

**Analyte & Samples(s) Qualified:**

**Lead**

2110542-37[D-9 (0'-2')], B290266-DUP1

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
MS-19	Sample to spike ratio is greater than or equal to 4:1. Spiked amount is not representative of the native amount in the sample. Appropriate or meaningful recoveries cannot be calculated.
R-02	Duplicate RPD is outside of control limits. Outlier can be attributed to sample non-homogeneity encountered during sample prep.
U	Analyte included in the analysis, but not detected

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

**SM 2540G****Qualifications:****R-02**

Duplicate RPD is outside of control limits. Outlier can be attributed to sample non-homogeneity encountered during sample prep.

**Analyte & Samples(s) Qualified:****% Solids**

2110945-46[Y-11 (0-2)], B290609-DUP2

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
R-02	Duplicate RPD is outside of control limits. Outlier can be attributed to sample non-homogeneity encountered during sample prep.
U	Analyte included in the analysis, but not detected

Good morning Chris,

Can you confirm the sample IDs for the attached please?

According to our receiving department: sample E-11 (0-2) @13:08 was listed on the COC twice and we received a Y-11 (0-2) @ 10:35 (9:16 was written on cap) that is not on the COC

Would you like us to add the sample Y-11 (0-2) to the end of the COC?

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

**SW-846 8082A**

**Qualifications:**

**S-01**

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

**Analyte & Samples(s) Qualified:**

**Decachlorobiphenyl**

2111417-20[C-10 (0.5-1.5)]

**Decachlorobiphenyl [2C]**

2111417-20[C-10 (0.5-1.5)]

**Tetrachloro-m-xylene**

2111417-20[C-10 (0.5-1.5)]

**Tetrachloro-m-xylene [2C]**

2111417-20[C-10 (0.5-1.5)]

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

**SW-846 8082A**

**Qualifications:**

**P-02**

Sample RPD between primary and confirmatory analysis exceeded 40%. Per EPA method 8000, the lower value was reported due to obvious chromatographic interference on the column with the higher result.

**Analyte & Samples(s) Qualified:**

**Aroclor-1254**

21I1418-20[Y-9 (0.5-1.5)]

**R-06**

Matrix spike duplicate RPD is outside of control limits. Reduced precision is anticipated for reported result for this compound in this sample.

**Analyte & Samples(s) Qualified:**

**Aroclor-1260 [2C]**

21I1418-07[V-12 (0.25-0.5)], B291149-MS1, B291149-MSD1

**S-01**

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

**Analyte & Samples(s) Qualified:**

**Decachlorobiphenyl**

21I1418-11[W-13 (0.25-0.5)]

**Decachlorobiphenyl [2C]**

21I1418-11[W-13 (0.25-0.5)]

**Tetrachloro-m-xylene**

21I1418-11[W-13 (0.25-0.5)]

**Tetrachloro-m-xylene [2C]**

21I1418-11[W-13 (0.25-0.5)]

**S-24**

Surrogate recovery is biased high due to the presence of Aroclor 1268 in the sample. Aroclor 1268 contains decachlorobiphenyl.

**Analyte & Samples(s) Qualified:**

**Decachlorobiphenyl**

21I1418-15[V-11 (0.25-0.5)]

**Decachlorobiphenyl [2C]**

21I1418-15[V-11 (0.25-0.5)]

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
P-02	Sample RPD between primary and confirmatory analysis exceeded 40%. Per EPA method 8000, the lower value was reported due to obvious chromatographic interference on the column with the higher result.
R-06	Matrix spike duplicate RPD is outside of control limits. Reduced precision is anticipated for reported result for this compound in this sample.
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.
S-24	Surrogate recovery is biased high due to the presence of Aroclor 1268 in the sample. Aroclor 1268 contains decachlorobiphenyl.

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level

Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.

No results have been blank subtracted unless specified in the case narrative section.

PURCHASE ORDER NUMBER:

PROJECT NUMBER: BANF0005

**ANALYTICAL SUMMARY**

WORK ORDER NUMBER: 2111825

The results of analyses performed on the following samples submitted to CON-TEST, a Pace Analytical Laboratory, are found in this report.

PROJECT LOCATION: 375 Banfield Rd., Portsmouth, NH

FIELD SAMPLE #	LAB ID:	MATRIX	SAMPLE DESCRIPTION	TEST	SUB LAB
G-6 (0.25-0.5)	2111825-01	Soil		SM 2540G SW-846 8082A	
G-6 (0.5-1.5)	2111825-02	Soil		SM 2540G SW-846 8082A	
G-7 (0.25-1.5)	2111825-03	Soil		SM 2540G SW-846 8082A	
G-7 (0.5-1.5)	2111825-04	Soil		SM 2540G SW-846 8082A	
G-7 (1.5-3)	2111825-05	Soil		SM 2540G SW-846 8082A	
F-8 (0.25-0.5)	2111825-06	Soil		SM 2540G SW-846 8082A	
F-8 (0.5-1.5)	2111825-07	Soil		SM 2540G SW-846 8082A	

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

**SW-846 8082A**

**Qualifications:**

**P-02**

Sample RPD between primary and confirmatory analysis exceeded 40%. Per EPA method 8000, the lower value was reported due to obvious chromatographic interference on the column with the higher result.

**Analyte & Samples(s) Qualified:**

**Aroclor-1254**

2111825-01[G-6 (0.25-0.5)]

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
P-02	Sample RPD between primary and confirmatory analysis exceeded 40%. Per EPA method 8000, the lower value was reported due to obvious chromatographic interference on the column with the higher result.
U	Analyte included in the analysis, but not detected

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

Project Location: 375 Banfield Rd., Portsmouth, NH      Sample Description:

Work Order: 2111826

Date Received: 9/30/2021

Field Sample #: I-3 (0.25-0.5)

Sampled: 9/30/2021 13:25

Sample ID: 2111826-11

Sample Matrix: Soil

**Polychlorinated Biphenyls with 3540 Soxhlet Extraction**

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
U	Analyte included in the analysis, but not detected

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

**SW-846 8082A**

**Qualifications:**

**P-02**

Sample RPD between primary and confirmatory analysis exceeded 40%. Per EPA method 8000, the lower value was reported due to obvious chromatographic interference on the column with the higher result.

**Analyte & Samples(s) Qualified:**

**Aroclor-1254**

2111827-01[HH-7-Mid (0.25-0.5)], 2111827-15[E-10 (0.25-0.5)]

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
P-02	Sample RPD between primary and confirmatory analysis exceeded 40%. Per EPA method 8000, the lower value was reported due to obvious chromatographic interference on the column with the higher result.
U	Analyte included in the analysis, but not detected

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

**SW-846 8082A**

**Qualifications:**

**S-01**

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

**Analyte & Samples(s) Qualified:**

**Decachlorobiphenyl**

2111828-18[E-5 (0.5-1.5)]

**Decachlorobiphenyl [2C]**

2111828-18[E-5 (0.5-1.5)]

**Tetrachloro-m-xylene**

2111828-18[E-5 (0.5-1.5)]

**Tetrachloro-m-xylene [2C]**

2111828-18[E-5 (0.5-1.5)]

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

Daren J. Damboragian  
Director of Operations

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.
U	Analyte included in the analysis, but not detected

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

**SW-846 8082A**

**Qualifications:**

**S-01**

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

**Analyte & Samples(s) Qualified:**

**Decachlorobiphenyl**

2111829-05[II-9 (0.25-0.5)], 2111829-07[J-10 (0.25-0.5)]

**Decachlorobiphenyl [2C]**

2111829-05[II-9 (0.25-0.5)], 2111829-07[J-10 (0.25-0.5)]

**Tetrachloro-m-xylene**

2111829-05[II-9 (0.25-0.5)], 2111829-07[J-10 (0.25-0.5)]

**Tetrachloro-m-xylene [2C]**

2111829-05[II-9 (0.25-0.5)], 2111829-07[J-10 (0.25-0.5)]

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.
U	Analyte included in the analysis, but not detected

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
O-04	Sample fingerprint does not match standard exactly. Sample was quantitated against the closest matching standard.
U	Analyte included in the analysis, but not detected

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

Daren J. Damboragian

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
U	Analyte included in the analysis, but not detected

Doc # 381 Rev 4\_01/08/2020

Company Name: Wilcox and Barton, Inc.
Address: #1B Commons Drive Unit 12B Londonderry, NH
Phone: 603 309 4190
Project Location: 375 Banfield Rd, Portsmouth NH
Project Number: BANF0005
Project Manager: Bill Wilcox
Con-Test Quote Name/Number:
Invoice Recipient:
Sampled By: B. Dutra

Requested Turnaround Time: 7-Day, 10-Day, PFAS 10-Day (std)
Rush-Approval Required: 1-Day, 3-Day, 2-Day, 4-Day
Data Delivery: Format: PDF, EXCEL, Other: PCB ONLY, SOXHLET, NON SOXHLET
Email To: wwilcox, mbroussard
Fax To #:

Table with 10 columns: VIALS, GLASS, PLASTIC, BACTERIA, ENCORE. Contains handwritten data for various sample types and quantities.

PCB 8082 with soxhlet extraction (35-40)

2 Preservation Code
Total Number Of:
VIALS
GLASS
PLASTIC
BACTERIA
ENCORE
Glassware in the fridge? Y/N
Glassware in freezer? Y/N
Prepackaged Cooler? Y/N
\*Contest is not responsible for missing samples from prepacked coolers
1 Matrix Codes:
GW = Ground Water
WW = Waste Water
DW = Drinking Water
A = Air
S = Soil
SL = Sludge
SOL = Solid
O = Other (please define)
2 Preservation Codes:
I = Iced
H = HCL
M = Methanol
N = Nitric Acid
S = Sulfuric Acid
B = Sodium Bisulfate
X = Sodium Hydroxide
T = Sodium Thiosulfate
O = Other (please define)

Main data table with columns: Con-Test Work Order#, Client Sample ID / Description, Beginning Date/Time, Ending Date/Time, COMP/GRAB, Matrix Code, Conc Code, VIALS, GLASS, PLASTIC, BACTERIA, ENCORE. Contains 10 rows of sample data.

**Login Sample Receipt Checklist - (Rejection Criteria Listing - Using Acceptance Policy) Any False Statement will be brought to the attention of the Client - State True or False**

Client Wilcox & Barton

Received By RLF Date 9/30/21 Time 1855

How were the samples received? In Cooler  No Cooler  On Ice  No Ice   
Direct from Sampling  Ambient  Melted Ice

Were samples within Temperature? 2-6°C  By Gun # 3 Actual Temp - 2.3 4.8°  
By Blank #  Actual Temp -

Was Custody Seal Intact?  NA Were Samples Tampered with?  NA

Was COC Relinquished?  T Does Chain Agree With Samples?  T

Are there broken/leaking/loose caps on any samples?  F

Is COC in ink/ Legible?  T Were samples received within holding time?  T

Did COC include all pertinent Information? Client  T Analysis  T Sampler Name  T  
Project  T ID's  T Collection Dates/Times  T

Are Sample labels filled out and legible?  T

Are there Lab to Filters?  F Who was notified?

Are there Rushes?  F Who was notified?

Are there Short Holds?  F Who was notified?

Is there enough Volume?  T

Is there Headspace where applicable?  NA MS/MSD?  F

Proper Media/Containers Used?  T Is splitting samples required?  F

Were trip blanks received?  F On COC?  F

Do all samples have the proper pH? Acid  NA Base  NA

 ATTN: William Wilcox

REPORT DATE: 10/11/2021

PURCHASE ORDER NUMBER:

PROJECT NUMBER: BANF0005

**ANALYTICAL SUMMARY**

WORK ORDER NUMBER: 2111836

The results of analyses performed on the following samples submitted to CON-TEST, a Pace Analytical Laboratory, are found in this report.

PROJECT LOCATION: 375 Banfield Rd., Portsmouth, NH

FIELD SAMPLE #	LAB ID:	MATRIX	SAMPLE DESCRIPTION	TEST	SUB LAB
GG-2-Mid (0.25-0.5)	2111836-01	Soil		SM 2540G SW-846 8082A

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

**SW-846 8082A**

**Qualifications:**

**S-01**

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

**Analyte & Samples(s) Qualified:**

**Decachlorobiphenyl**

2111836-09[I-5-Mid (0.25-0.5)], 2111836-18[JJ-9 (0.25-0.5)], 2111836-19[JJ-9 (0.5-1.5)]

**Decachlorobiphenyl [2C]**

2111836-09[I-5-Mid (0.25-0.5)], 2111836-18[JJ-9 (0.25-0.5)], 2111836-19[JJ-9 (0.5-1.5)]

**Tetrachloro-m-xylene**

2111836-09[I-5-Mid (0.25-0.5)], 2111836-18[JJ-9 (0.25-0.5)], 2111836-19[JJ-9 (0.5-1.5)]

**Tetrachloro-m-xylene [2C]**

2111836-09[I-5-Mid (0.25-0.5)], 2111836-18[JJ-9 (0.25-0.5)], 2111836-19[JJ-9 (0.5-1.5)]

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

Daren J. Damboragian  
Director of Operations

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.
U	Analyte included in the analysis, but not detected

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

**SW-846 8082A**

**Qualifications:**

**O-04**

Sample fingerprint does not match standard exactly. Sample was quantitated against the closest matching standard.

**Analyte & Samples(s) Qualified:**

**Aroclor-1242**

2111839-12[D-3 (0.25-0.5)]

**Aroclor-1242 [2C]**

2111839-12[D-3 (0.25-0.5)]

**S-02**

The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.

**Analyte & Samples(s) Qualified:**

**Decachlorobiphenyl [2C]**

2111839-20[E-2 (0.25-0.5)]

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
O-04	Sample fingerprint does not match standard exactly. Sample was quantitated against the closest matching standard.
S-02	The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

Daren J. Damboragian  
Director of Operations

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
U	Analyte included in the analysis, but not detected

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
U	Analyte included in the analysis, but not detected

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

**SW-846 8082A****Qualifications:**

**S-24**  
Surrogate recovery is biased high due to the presence of Aroclor 1268 in the sample. Aroclor 1268 contains decachlorobiphenyl.

**Analyte & Samples(s) Qualified:****Decachlorobiphenyl**

21J0244-07RE1[Y-11 (0.25-0.5)], 21J0244-17RE1[X-10 (0.25-0.5)]

**Decachlorobiphenyl [2C]**

21J0244-11RE1[Z-12 (0.25-0.5)], 21J0244-12RE1[Z-12 (0.5-1.5)], 21J0244-17RE1[X-10 (0.25-0.5)]

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
S-24	Surrogate recovery is biased high due to the presence of Aroclor 1268 in the sample. Aroclor 1268 contains decachlorobiphenyl.
U	Analyte included in the analysis, but not detected

REPORT DATE: 10/27/2021

PURCHASE ORDER NUMBER:

PROJECT NUMBER: BANF0005

**ANALYTICAL SUMMARY**

WORK ORDER NUMBER: 21J1183

The results of analyses performed on the following samples submitted to CON-TEST, a Pace Analytical Laboratory, are found in this report.

PROJECT LOCATION: 375 Banfield Rd

FIELD SAMPLE #	LAB ID:	MATRIX	SAMPLE DESCRIPTION	TEST	SUB LAB
B-1 0-1.0 FT	21J1183-01	Soil		SM 2540G SW-846 8100 Modified	
B-1 1.0-2.0 FT	21J1183-02	Soil		SM 2540G SW-846 8100 Modified	
B-2 0.5-1.5 FT	21J1183-03	Soil		SM 2540G SW-846 8100 Modified	
B-3 0.5-1.5 FT	21J1183-04	Soil		SM 2540G SW-846 8100 Modified	
B-4 1.0-2.0 FT	21J1183-05	Soil		SM 2540G SW-846 8100 Modified	

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

**SW-846 8100 Modified**

**Qualifications:**

**S-01**

The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.

**Analyte & Samples(s) Qualified:**

**2-Fluorobiphenyl**

21J1183-03[B-2 0.5-1.5 FT]

**SW-846 8100 Modified**

TPH (C9-C36) is quantitated against a calibration made with a diesel standard.

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
S-01	The surrogate recovery for this sample is not available due to sample dilution below the surrogate reporting limit required from high analyte concentration and/or matrix interferences.
U	Analyte included in the analysis, but not detected

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

For method 8270E, only PAHs were requested and reported.

**MADEP EPH rev 2.1****Qualifications:****S-19**

Surrogate recovery is outside of control limits, matrix interference suspected. Reanalysis yielded similar surrogate non-conformance.

**Analyte & Samples(s) Qualified:****Chlorooctadecane (COD)**

2111172-06[SD-204], 2111172-06RE1[SD-204], 2111172-07[SD-205], 2111172-07RE1[SD-205], 2111172-08[SD-206], 2111172-08RE1[SD-206], 2111172-09[SD-207], 2111172-09RE1[SD-207]

**o-Terphenyl (OTP)**

2111172-06[SD-204], 2111172-07[SD-205], 2111172-08[SD-206], 2111172-08RE1[SD-206], 2111172-09[SD-207]

**SW 846 9060A****Qualifications:****MS-11**

Matrix spike recovery outside of control limits. Possibility of sample matrix effects that lead to a high bias for reported result or non-homogeneous sample aliquots cannot be eliminated.

**Analyte & Samples(s) Qualified:****Total Organic Carbon**

2111172-02[SD-201], B291136-MS1

**Z-01**

Results over calibration curve. Results are estimated due to method limitations.

**Analyte & Samples(s) Qualified:****Total Organic Carbon**

2111172-02[SD-201], 2111172-05[SD-203], 2111172-06[SD-204], 2111172-07[SD-205], 2111172-08[SD-206], 2111172-09[SD-207], B291136-DUP1, B291136-MS1

**SW-846 7470A****Qualifications:****B**

Analyte is found in the associated laboratory blank as well as in the sample.

**Analyte & Samples(s) Qualified:****Mercury**

2111172-01[SW-201], 2111172-04[SW-203], B290978-BLK1, B290978-DUP1

**SW-846 8270E****Qualifications:****RL-12**

Elevated reporting limit due to matrix interference.

**Analyte & Samples(s) Qualified:**

2111172-05[SD-203], 2111172-06[SD-204], 2111172-07[SD-205], 2111172-08[SD-206]

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

**FLAG/QUALIFIER SUMMARY**

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
B	Analyte is found in the associated laboratory blank as well as in the sample.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
MS-11	Matrix spike recovery outside of control limits. Possibility of sample matrix effects that lead to a high bias for reported result or non-homogeneous sample aliquots cannot be eliminated.
RL-12	Elevated reporting limit due to matrix interference.
S-19	Surrogate recovery is outside of control limits, matrix interference suspected. Reanalysis yielded similar surrogate non-conformance.
U	Analyte included in the analysis, but not detected
Z-01	Results over calibration curve. Results are estimated due to method limitations.

**ANALYTICAL SUMMARY**

WORK ORDER NUMBER: 2111325

The results of analyses performed on the following samples submitted to CON-TEST, a Pace Analytical Laboratory, are found in this report.

PROJECT LOCATION: 375 Banfield Rd, Portsmouth, NH

FIELD SAMPLE #	LAB ID:	MATRIX	SAMPLE DESCRIPTION	TEST	SUB LAB
SW-211	2111325-12	Surface Water		EPA 200.7 EPA 300.0 SM21-23 2540C SM21-23 2540D SW-846 6010D SW-846 6020B SW-846 7470A SW-846 8270E	
SW-212	2111325-13	Surface Water		EPA 200.7 EPA 300.0 SM21-23 2540C SM21-23 2540D SW-846 6010D SW-846 6020B SW-846 7470A SW-846 8270E	

**CASE NARRATIVE SUMMARY**

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

For method 8270E, only PAHs were requested and reported.

39 Spruce Street \* East Longmeadow, MA 01028 \* FAX 413/525-6405 \* TEL. 413/525-2332

**MADEP EPH rev 2.1****Qualifications:****MS-22**

Either matrix spike or MS duplicate is outside of control limits, but the other is within limits. RPD between the two MS/MSD results is within method specified criteria.

**Analyte & Samples(s) Qualified:****Naphthalene**

B290945-MSD1

**R-05**

Laboratory fortified blank duplicate RPD is outside of control limits. Reduced precision is anticipated for any reported value for this compound.

**Analyte & Samples(s) Qualified:****Acenaphthene**

2111325-01[SD-208], 2111325-02[SD-209], B290945-BLK1, B290945-BS1, B290945-BSD1, B290945-MS1, B290945-MSD1

**Acenaphthylene**

2111325-01[SD-208], 2111325-02[SD-209], B290945-BLK1, B290945-BS1, B290945-BSD1, B290945-MS1, B290945-MSD1

**S-26**

Surrogate outside of control limits.

**Analyte & Samples(s) Qualified:****2-Bromonaphthalene**

B290945-MS1

**2-Fluorobiphenyl**

B290945-MS1

**SM 2540G****Qualifications:****R-02**

Duplicate RPD is outside of control limits. Outlier can be attributed to sample non-homogeneity encountered during sample prep.

**Analyte & Samples(s) Qualified:****% Solids**

2111325-05[SD-212], 2111325-09[SD-217], B291142-DUP3, B291142-DUP7

**SW 846 9060A****Qualifications:****MS-11**

Matrix spike recovery outside of control limits. Possibility of sample matrix effects that lead to a high bias for reported result or non-homogeneous sample aliquots cannot be eliminated.

**Analyte & Samples(s) Qualified:****Total Organic Carbon**

2111325-04[SD-211], B291244-MS1

**Z-01**

Results over calibration curve. Results are estimated due to method limitations.

**Analyte & Samples(s) Qualified:****Total Organic Carbon**

2111325-01[SD-208], 2111325-02[SD-209], 2111325-06[SD-213], 2111325-07[SD-214], 2111325-08[SD-215], 2111325-09[SD-217]

**SW-846 7470A****Qualifications:****B**

Analyte is found in the associated laboratory blank as well as in the sample.

**Analyte & Samples(s) Qualified:****Mercury**

2111325-10[SW-208], 2111325-11[SW-210], 2111325-12[SW-211], 2111325-13[SW-212], B290978-BLK1

**SW-846 7471B****Qualifications:**

---

39 Spruce Street \* East Longmeadow, MA 01028 \* FAX 413/525-6405 \* TEL. 413/525-2332

---

**R-02**

Duplicate RPD is outside of control limits. Outlier can be attributed to sample non-homogeneity encountered during sample prep.

**Analyte & Samples(s) Qualified:**

**Mercury**

2111325-08[SD-215], B291002-DUP1

**SW-846 8270E**

**Qualifications:**

---

**RL-12**

Elevated reporting limit due to matrix interference.

**Analyte & Samples(s) Qualified:**

2111325-02[SD-209], 2111325-03[SD-210], 2111325-04[SD-211], 2111325-05[SD-212], 2111325-06[SD-213]

---

**V-06**

Continuing calibration verification (CCV) did not meet method specifications and was biased on the high side for this compound.

**Analyte & Samples(s) Qualified:**

**Bis(2-ethylhexyl)phthalate (SIM)**

S063774-CCV1

The results of analyses reported only relate to samples submitted to Con-Test, a Pace Analytical Laboratory, for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.
