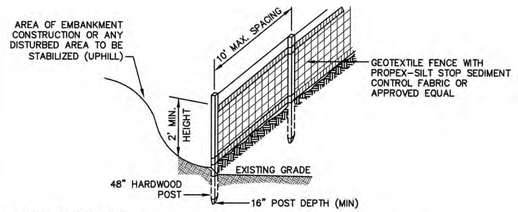
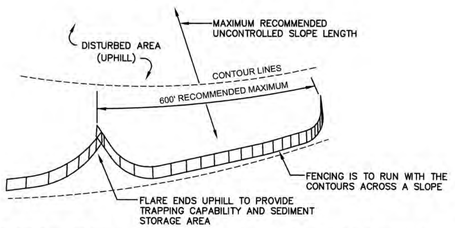
1. ALL MATERIAL TO MEET FILTREXX® SPECIFICATIONS.
2. SILT SOXX™ FILL TO MEET APPLICATION REQUIREMENTS.
3. COMPOST MATERIAL TO BE DISPERSED ON SITE, AS DETERMINED BY ENGINEER.

### FILTREXX® SILT SOXX™

NOT TO SCALE





**CONSTRUCTION SPECIFICATIONS:**

1. WOVEN FABRIC FENCE TO BE FASTENED SECURELY TO FENCE POSTS WITH WIRE TIES OR STAPLES. FILTER CLOTH SHALL BE FASTENED TO WOVEN WIRE EVERY 24" AT TOP, MID AND BOTTOM AND EMBEDDED IN THE GROUND A MINIMUM OF 8" AND THEN COVERED WITH SOIL.
2. THE FENCE POSTS SHALL BE A MINIMUM OF 48" LONG, SPACED A MAXIMUM 10' APART, AND DRIVEN A MINIMUM OF 16" INTO THE GROUND.
3. WHEN TWO SECTIONS OF FILTER CLOTH ADJOIN EACH OTHER, THE ENDS OF THE FABRIC SHALL BE OVERLAPPED 6", FOLDED AND STAPLED TO PREVENT SEDIMENT FROM BY-PASSING.
4. MAINTENANCE SHALL BE PERFORMED AS NEEDED AND SEDIMENT REMOVED AND PROPERLY DISPOSED OF WHEN IT IS 6" DEEP OR VISIBLE 'BULGES' DEVELOP IN THE SILT FENCE.
5. PLACE THE ENDS OF THE SILT FENCE UP CONTOUR TO PROVIDE FOR SEDIMENT STORAGE.
6. SILT FENCE SHALL REMAIN IN PLACE FOR 24 MONTHS.
7. SILT FENCES SHALL BE REMOVED WHEN NO LONGER NEEDED AND THE SEDIMENT COLLECTED SHALL BE DISPOSED AS DIRECTED BY THE ENGINEER. THE AREA DISTURBED BY THE REMOVAL SHALL BE SMOOTHED AND REVEGETATED.

**MAINTENANCE:**

1. SILT FENCES SHALL BE INSPECTED IMMEDIATELY AFTER EACH RAINFALL AND AT LEAST DAILY DURING PROLONGED RAINFALL. ANY REPAIRS THAT ARE REQUIRED SHALL BE DONE IMMEDIATELY.
2. IF THE FABRIC ON A SILT FENCE SHOULD DECOMPOSE OR BECOME INEFFECTIVE DURING THE EXPECTED LIFE OF THE FENCE, THE FABRIC SHALL BE REPLACED PROMPTLY.
3. SEDIMENT DEPOSITS SHOULD BE INSPECTED AFTER EVERY STORM EVENT. THE DEPOSITS SHOULD BE REMOVED WHEN THEY REACH APPROXIMATELY ONE HALF THE HEIGHT OF THE BARRIER.
4. SEDIMENT DEPOSITS THAT ARE REMOVED, OR LEFT IN PLACE AFTER THE FABRIC HAS BEEN REMOVED, SHALL BE GRADED TO CONFORM WITH THE EXISTING TOPOGRAPHY AND VEGETATED.

### SILT FENCE

## SEEDING SPECIFICATIONS

1. GRADING AND SHAPING
   A. SLOPES SHALL NOT BE STEEPER THAN 2:1 WITHOUT APPROPRIATE EROSION CONTROL MEASURES AS SPECIFIED ON THE PLANS (3:1 SLOPES OR FLATTER ARE PREFERRED).
   B. WHERE MOWING WILL BE DONE, 3:1 SLOPES OR FLATTER ARE RECOMMENDED.
2. SEEDBED PREPARATION
   A. SURFACE AND SEEPAGE WATER SHOULD BE DRAINED OR DIVERTED FROM THE SITE TO PREVENT DROWNING OR WINTER KILLING OF THE PLANTS.
   B. STONES LARGER THAN 4 INCHES AND TRASH SHOULD BE REMOVED BECAUSE THEY INTERFERE WITH SEEDING AND FUTURE MAINTENANCE OF THE AREA. WHERE FEASIBLE, THE SOIL SHOULD BE TILLED TO A DEPTH OF ABOUT 4 INCHES TO PREPARE A SEEDBED AND FERTILIZER AND LIME MIXED INTO THE SOIL. THE SEEDBED SHOULD BE LEFT IN A REASONABLY FIRM AND SMOOTH CONDITION. THE LAST TILLAGE OPERATION SHOULD BE PERFORMED ACROSS THE SLOPE WHEREVER PRACTICAL.
3. ESTABLISHING A STAND
   A. LIME AND FERTILIZER SHOULD BE APPLIED PRIOR TO OR AT THE TIME OF SEEDING AND INCORPORATED INTO THE SOIL. TYPES AND AMOUNTS OF LIME AND FERTILIZER SHOULD BE BASED ON AN EVALUATION OF SOIL TESTS. WHEN A SOIL TEST IS NOT AVAILABLE, THE FOLLOWING MINIMUM AMOUNTS SHOULD BE APPLIED:
      AGRICULTURAL LIMESTONE, 2 TONS PER ACRE OR 100 LBS. PER 1,000 SQ.FT.
      NITROGEN(N), 50 LBS. PER ACRE OR 1.1 LBS. PER 1,000 SQ.FT.
      PHOSPHATE(P2O5), 100 LBS. PER ACRE OR 2.2 LBS. PER 1,000 SQ.FT.
      POTASH(K2O), 100 LBS. PER ACRE OR 2.2 LBS. PER 1,000 SQ.FT.
      (NOTE: THIS IS THE EQUIVALENT OF 500 LBS. PER ACRE OF 10-20-20 FERTILIZER OR 1,000 LBS. PER ACRE OF 5-10-10.)
   B. SEED SHOULD BE SPREAD UNIFORMLY BY THE METHOD MOST APPROPRIATE FOR THE SITE. METHODS INCLUDE BROADCASTING, DRILLING AND HYDROSEEDING. WHERE BROADCASTING IS USED, COVER SEED WITH .25 INCH OF SOIL OR LESS, BY CULTIPACKING OR RAKING.
   C. REFER TO THE 'SEEDING GUIDE' AND 'SEEDING RATES' TABLES ON THIS SHEET FOR APPROPRIATE SEED MIXTURES AND RATES OF SEEDING. ALL LEGUMES (CROWNVETCH, BIRDSFOOT, TREFOIL AND FLATPEA) MUST BE INOCULATED WITH THEIR SPECIFIC INOCULANT PRIOR TO THEIR INTRODUCTION TO THE SITE.
   D. WHEN SEEDED AREAS ARE MULCHED, PLANTINGS MAY BE MADE FROM EARLY SPRING TO EARLY OCTOBER. WHEN SEEDED AREAS ARE NOT MULCHED, PLANTINGS SHOULD BE MADE FROM EARLY SPRING TO MAY 20th OR FROM AUGUST 10th TO SEPTEMBER 1st.
4. MULCH
   A. HAY, STRAW, OR OTHER MULCH, WHEN NEEDED, SHOULD BE APPLIED IMMEDIATELY AFTER SEEDING.
   B. MULCH WILL BE HELD IN PLACE USING APPROPRIATE TECHNIQUES FROM THE BEST MANAGEMENT PRACTICE FOR MULCHING. HAY OR STRAW MULCH SHALL BE PLACED AT A RATE OF 90 LBS PER 1000 S.F.
5. MAINTENANCE TO ESTABLISH A STAND
   A. PLANTED AREAS SHOULD BE PROTECTED FROM DAMAGE BY FIRE, GRAZING, TRAFFIC, AND DENSE WEED GROWTH.
   B. FERTILIZATION NEEDS SHOULD BE DETERMINED BY ONSITE INSPECTIONS. SUPPLEMENTAL FERTILIZER IS USUALLY THE KEY TO FULLY COMPLETE THE ESTABLISHMENT OF THE STAND BECAUSE MOST PERENNIALS TAKE 2 TO 3 YEARS TO BECOME FULLY ESTABLISHED.
   C. IN WATERWAYS, CHANNELS, OR SWALES WHERE UNIFORM FLOW CONDITIONS ARE ANTICIPATED, ANNUAL MOWING MAY BE NECESSARY TO CONTROL GROWTH OF WOODY VEGETATION.

**Tax Map 292, Lots 151-1 & 151-2**
**JBE Project No. 18165**

Dear Mr. Legg,

We are in receipt of comments from Jillian Harris dated December 3, 2019. Review comments are listed below with our responses in bold.

1. *The driveway should be shifted to the north on Ocean Road, to provide greater separation from the driveway to Lot 152, to avoid the three-lane section of Ocean Road as much as possible, and to better align with the driveway to the Fire Station on the opposite side of Ocean Road.*
   **RESPONSE: It is not possible for the driveway to be moved to the north on Ocean Road.**

2. *The driveway will require approval from NHDOT, as Ocean Road is a state highway.*
   **RESPONSE: We have applied for a NHDOT permit on November 12, 2019.**

3. *The dumpster location appears difficult to be accessed by the trash truck, without blocking the access road. Could it be placed closer to Lafayette Road at the end of the access road?*
   **RESPONSE: The dumpster pad has been removed. Each unit will have separate trash cans to be stored inside each garage with pick-up by a private company. A note has been added to the Site Plan as note #21.**

4. *Please indicate where visitor parking is provided.*
   **RESPONSE: Each unit will have 2 garage parking spaces and 2 spaces located in the driveway. In addition, 3 visitor parking spaces have been added along the access driveway.**

5. *Test pit data missing.*
   **RESPONSE: Test pit data is included with this response.**

6. *STOP sign should be 30"x 30", not 36".*
   **RESPONSE: Stop sign has been changed to 30" x 30".**

7. *Concern about loading of all the stormwater in one corner of the site against the property line. This may negatively influence the adjoining property.*
   **RESPONSE: Currently stormwater flows to all four sides of the property and will continue to do so in post development conditions. Stormwater from most of the newly paved areas will flow to a subsurface infiltration system. The location of the infiltration system was chosen as the soil conditions in this area will allow for infiltration much better than any other portion of the site. The outlet to the infiltration system is pointed to the existing storm drainage system in Lafayette Road and not toward the abutting property.**

8. *Stormwater detention may need to be spread out across the site.*
   **RESPONSE: There is minimal stormwater runoff from this site in its existing state. We have revised the drainage system so that the Post Development drainage runoff matches the Pre-Development runoff rate more closely. We have raised the entire system an additional 7" to allow for more separation to ground water. We have also reduced the size of the infiltration system and moved it as far away as possible from the abutting property line. In the 50-year storm event, the total Post Development runoff rate from the site toward the drainage system in Lafayette Road matches the Pre-Development rate exactly so there will be no increase or decrease in stormwater runoff. We are mimicking the existing conditions and infiltrating the same amount of stormwater in the proposed conditions as happens now.**

9. *Water/sewer services should come out of the structure in heated space, not from garage. Will need space on first floor for utility room for water meter, etc.*
   **RESPONSE: All utilities under garage slabs will be sleeved. A note has been added to the Utility Plan as note #42.**

10. *Capping of existing services not shown.*
    **RESPONSE: Capping of existing services are on Sheet DM-1, Notes 3 & 4.**

11. *12' easement to NHDOT should be provided.*
    **RESPONSE: A twelve-foot easement for NHDOT from Lafayette Road is shown on the Site Plan Sheet C2.**

12. *Proposed transformer may be too close to structure.*
    **RESPONSE: The proposed transformer has been relocated. We are starting the review process with Eversource and will be getting an official design from them soon.**

13. *Fire services should be shown as 'to be determined' once MEP plans are complete.*
    **RESPONSE: A note has been added to the Utility Plan Sheet C4 that fire service sizes are approximate as note #41.**

14. *C900 water main may not be approved, need review by Portsmouth water department.*
    **RESPONSE: The C900 water main is being reviewed by the Portsmouth Water Department.**

15. *Screening from RT1 should be provided.*
**RESPONSE: The frontage along Route 1 has natural screening that will remain.**

16. *Pavement thickness is minimal for a multi-dwelling site using dumpster pickup.*
**RESPONSE: 3" pavement thickness was provided, have bumped it up to 3.25"**

17. *The stormwater treatment for this property shows a proposed 1,276 R Tank Chamber. Is there adequate separation from the Estimated Seasonal High-Water table for the proposed installation?*
**RESPONSE: Yes, the bottom of the stone for the infiltration system is at 96.4. There will be 1.6' of separation from the bottom of the system to the Estimated Seasonal High Water at 94.8.**

18. *Given the amount of new impervious surface on this lot is there any stormwater treatment beyond the proposed chambers?*
**RESPONSE: The catch basins will all have sumps and grease hoods to aid in stormwater treatment. Stormwater from paved areas will enter an infiltration system allowing further treatment. The buildings will have drip edges to catch roof runoff from half of the roofs, which will also infiltrate.**

19. *Truck Turning Plan – The plan and the turning radius of WB-50 vehicle appears to show a minor conflict with any outdoor parking associated with townhouse unit #12.*
**RESPONSE: We have revised the Truck Turning Plan to show a standard fire truck. There is no conflict with any outdoor parking with this truck.**

20. *Architectural Elevations – Rear-facing roof canopies or decks should be considered over the garages on the 6-unit townhouse units. A small roof canopy should also be considered to provide cover and reduce the blank wall over the rear pedestrian doors.*
**RESPONSE: Rear-facing roof canopies or decks are being considered over the garages on the 6-unit townhouse units. A small roof canopy is also be considered to provide cover and reduce the blank wall over the rear pedestrian doors.**

21. *Solid Waste Removal – The proposed dumpster plan should confirm that trucks will be able to remove the proposed dumpsters without leaving the proposed driveway.*
**RESPONSE: The dumpster pad has been eliminated in favor of trash cans in garages which are private.**

22. *The location of the dumpster pad should be more internal to the site or at least further from abutting properties.*
**RESPONSE: See above.**

23. *Bituminous Sidewalk – Due to durability and maintenance concerns, consideration should be given to using concrete for the sidewalks.*
**RESPONSE: Bituminous sidewalks have been replaced with concrete sidewalks.**

24. *Landscape Plan – If the existing vegetative buffer is inadequate, fencing should also be considered along the property lines abutting other residential properties.*
**RESPONSE: The proposed fence along the northern property line has been extended along the western property line as requested.**

Included with this response letter are the following:

1. Three (3) Revised Full Size Plan Set Folded.
2. Seven (7) Revised Half Size Plan Set Folded.

# TABLE OF CONTENTS

## EXECUTIVE SUMMARY

Tuck Realty Corporation proposes to construct 18 single family townhouses on a 2.19-acre parcel of land located on Lafayette Road and Ocean Road in Portsmouth, NH. This parcel of land is currently 3 parcels with 2 single-family homes. Two of the parcels will be consolidated and a lot line adjustment will be performed to create this 2.19-acre parcel for this development. A drainage analysis of the entire site was conducted for the purpose of estimating the peak rate of stormwater runoff and to subsequently design adequate drainage structures. Two models were compiled, one for the area in its existing (pre-construction) condition, and a second for its proposed (post-construction) condition. The analysis was conducted using data for the 2 Year – 24 Hour (3.24"), 10 Year – 24 Hour (4.92"), 25 Year – 24 Hour (6.24"), and 50 Year – 24 Hour (7.48") storm events using the USDA SCS TR-20 method within the HydroCAD Stormwater Modeling System environment. A summary of the existing and proposed conditions peak rates of runoff is as follows:

| **Analysis Point** | 2 Year | | 10 Year | | 25 Year | | 50 Year | |
|---|---|---|---|---|---|---|---|---|
| | Pre | Post | Pre | Post | Pre | Post | Pre | Post |
| Analysis Point #1 | 0.40 | 0.15 | 1.49 | 0.59 | 2.54 | 1.03 | 3.63 | 1.49 |
| Analysis Point #2 | 0.22 | 0.16 | 0.98 | 0.52 | 1.74 | 0.94 | 2.53 | 2.53 |
| Analysis Point #3 | 0.07 | 0.19 | 0.36 | 0.51 | 0.65 | 0.79 | 0.95 | 1.07 |

The project site is located in the Single Residence B Zoning District. The subject parcel consists of two single family homes with associated parking and lawn areas. There is a wooded tree buffer along Lafayette Road and along both easterly and westerly property lines. Both homes are serviced by City water and sewer along with underground electric and natural gas. The existing topography shows a hill located on the southeast corner of the property which allows stormwater runoff to flow in all directions off of the property. The existing site has been broken down into 4 Analysis Points. Subcatchment 1 flows east to west to the abutting property to the west. Subcatchment 2 flows southerly to the city storm drainage system located in Lafayette Road. Subcatchment 3 flows easterly to a city storm drainage system located in Ocean Road. Subcatchment 4 flows northerly to the abutting property.

The proposed site development consists of the aforementioned 18 single family townhouses with associated parking and the construction of approximately 450 feet of roadway. The same 4 Analysis Points were used in the Post Development Analysis. The runoff from the majority of the developed area will be stored and infiltrated into the surrounding soil. Runoff from the periphery of the site will still flow in the original direction.

The use of Best Management Practices per the NHDES Stormwater Manual have been applied to the design of this drainage system and will be observed during all stages of construction. All land disturbed during construction will be stabilized within thirty days of groundbreaking and abutting property owners will suffer minimal adversity resultant of this development.

## 1.0 RAINFALL CHARACTERISTICS

This drainage report includes an existing conditions analysis of the area involved in the proposed development, as well as a proposed condition, or post-construction analysis, of the same location. These analyses were accomplished using the USDA SCS TR-20 Method within the HydroCAD Stormwater Modeling System. The curve numbers were developed using the SCS TR-55 Runoff Curve numbers for Urban Areas. A Type III SCS 24-hour rainfall distribution was utilized in analyzing the data for the 2 Year – 24 Hour (3.24"), 10 Year – 24 Hour (4.92"), 25 Year – 24 Hour (6.24"), and 50 Year – 24 Hour (7.48") storm events.

As the table in the Executive Summary demonstrates, the proposed peak rates of runoff will be reduced from the existing conditions of the site in most locations, thereby minimizing any potential for a negative impact on abutting properties or infrastructure by allowing for better control of peak rates of stormwater runoff. There will be a small increase in peak runoff from Subcatchment 3, which flows to the City Storm Drainage system in Ocean Road.

## 2.0 EXISTING CONDITIONS ANALYSIS

The subject parcel consists of two single family homes with associated parking and lawn areas. There is a wooded tree buffer along Lafayette Road and along both easterly and westerly property lines. Both homes are serviced by City water and sewer along with underground electric and natural gas. The existing topography shows a hill located on the southeast corner of the property which allows stormwater runoff to flow in all directions off of the property with generally flat slopes.

The existing site has been broken down into 4 Subcatchment areas. Subcatchment 1 consists of mostly lawn area along with a portion of the existing structure and driveway that flows generally westerly onto the abutting property. Subcatchment 2 consists of lawn and forested buffer areas along with a portion of the house and driveway that flows southerly to the City drainage system in Lafayette Road. Subcatchment 3 consists of mostly forested buffer area that flows easterly to abutting property and out to the City drainage system in Ocean Road. Finally, Subcatchment 4 consists of an existing structure and driveway and flows northerly to the abutting property.

Classified through the use of a Natural Resources Conservation Services (NRCS) Web Sol Survey, the land of the site is composed of two soil types. The in-situ soils are categorized into Hydrologic Soil Group (HSG) B. The infiltration rate, or saturated hydraulic conductivity (Ksat) value was determined using the 'Ksat Values for New Hampshire Soils', SSSNNE Special Publication No. 5, September, 2009. The in-situ soil in the area of infiltration is Urban Land-Canton Complex which has a minimum Ksat value of 6.0 inches/hour. A factor of safety of 2 was applied and a Ksat value of 3.0 inches/hour was used in the analysis.

## 3.0 PROPOSED CONDITIONS ANALYSIS

The addition of the proposed impervious paved areas and homes causes an increase in the curve number ($C_n$) while maintain a minimum time of concentration ($T_c$), the net result being a potential increase in peak rates of runoff from the site. The proposed site development consists of the aforementioned 18 single family townhouses. The construction of approximately 450 feet of roadway, townhouses, driveways, along with the use of drip edges and catch basins, split the site into 9 subcatchments. The runoff from the developed area will be directed via site grading and drainage systems to a subsurface infiltration system consisting of R-Tanks located under the pavement on the southwesterly portion of the site. All of the water from the paved area and portions of the roofs is being directed to the subsurface infiltration system and is being infiltrated at the Ksat value mentioned above (3 in/hr), resulting in a decrease in offsite runoff at both Analysis Point 1 and 2. There is a small increase in runoff at Analysis Point 3, which flows to the City drainage system in Ocean Road. Analysis Point 4 is unchanged between predevelopment and post development but has been included as it is part of the overall project area.

## 4.0 SEDIMENT & EROSION CONTROL BEST MANAGEMENT PRACTICES

The proposed site development is protected from erosion and the roadways and abutting properties are protected from sediment by the use of Best Management Practices as outlined in the NHDES Stormwater Manual. Any area disturbed by construction will be re-stabilized within 30 days and abutting properties will suffer minimal adversity resultant of this development. All swales and drainage structures will be constructed and stabilized prior to having runoff directed to them.

### 4.1 Silt Soxx / Construction Fence

The plan set demonstrates the location of silt Soxx for sediment control. Sheet E1 – Erosion and Sediment Control Details, has the specifications for installation and maintenance of the Silt Soxx. In areas where the limits of construction need to be emphasized to operators, construction fence for added visibility will be installed. Orange construction fence will be VISI Perimeter Fence by Conwed Plastic Fencing, or equal. The four-foot fencing to be installed using six foot posts at least two feet in the ground at a spacing of six to eight feet.

### 4.2 Stabilized Construction Entrance

A temporary gravel construction entrance provides an area where mud can be dislodged from tires before the vehicle leaves the construction site to reduce the amount of mud and sediment transported onto paved municipal and state roads. The stone size for the pad should be between 1 to 2 inch coarse aggregate, and the pad itself constructed to a minimum length of 50 feet for the full width of the access road. The aggregate should be placed at least six inches thick. A plan view and profile are shown on Sheet E1.

### 4.3 Environmental Dust Control

Dust will be controlled on the site by the use of multiple Best Management Practices. Mulching and temporary seeding will be the first line of protection to be utilized where problems occur. If dust problems are not solved by these applications, the use of water can be applied. Dump trucks hauling material from the construction site will be covered with a tarpaulin.

## 4.4 Vegetated Stabilization

All areas that are disturbed during construction will be stabilized with vegetated material within 30 days of breaking ground. Construction will be managed in such a manner that erosion is prevented and that no abutting property will be subjected to any siltation, unless otherwise permitted. All areas to be planted with grass for long-term cover will follow the specification on Sheet E1 using seeding mixture C.

## 4.5 Temporary Sediment Traps

Temporary Sediment Traps are small temporary ponding areas that are formed by excavation or by constructing an earthen embankment across a drainage way and providing a stabilized outlet. These structures intercept sediment-laden runoff from small, disturbed areas and detain it long enough for the majority of the sediment to settle out into the sump of the trap.

## 4.6 Riprap Outlet Protection

Riprap Outlet Protection will be provided at the outlet of all culverts that discharge runoff into the environment (as opposed to a catch basin). The riprap outlet protection has been designed with the equations provided in the NHDES Stormwater Manual depending on inlet or outlet control. Details of the protection design can be found on Sheet E1 – Erosion & Sediment Control Details.

## 4.7 Catch Basins

A catch basin is a pre-cast concrete structure intended for the capture of stormwater utilized in streets and parking areas. All catch basins are to be equipped with three-foot sedimentation sumps in order to provide an area for sediment to settle out of runoff prior to its discharge from the structure. Grease hoods attached to the outlet pipe of the structures allow for the capture of grease, oils, and other floatable solids from runoff, thereby minimizing their presence in the subsequent discharge.

## 4.8 Construction Sequence

1. Prior to the start of *any* activity, it is the responsibility of the site's Developer (or Owner) to file a Notice of Intent (NOI) form and a copy of one (shared) Stormwater Pollution Prevention Plan (SWPPP) with the U.S. Environmental Protection Agency (EPA) in order to gain coverage under the NPDES General Permit for Stormwater Discharges from Construction Activities. A pre-construction meeting shall be held prior to the start of construction to discuss the SWPPP and all associated responsibilities. Participants shall include the developer (or owner), the General Contractor, the Site Contractor, and the Engineer.

2. Cut and remove trees in construction area as required or directed.

3. Install silt fencing, and construction entrances prior to the start of earthwork. These shall be maintained until the final pavement surfacing and landscaping areas are established.

4. Clear, cut, grub, and dispose of debris in approved facilities. This includes any required demolition of existing structures, utilities, etc.

5. Construct and/or install temporary sediment basin(s) as required. These facilities shall be installed and stabilized prior to directing runoff to them.

6. Strip loam and pavement, or reclaim existing pavement within limits of work per the recommendations of the project engineer and stockpile excess material. Stabilize stockpile as necessary.

7. Perform preliminary site grading in accordance with the plans, including the construction of any stormwater detention/retention ponds, drainage swales, retaining walls, and sound walls.

8. Prepare building pad(s) to enable building construction to begin.

9. Install the sewer and drainage systems first, then any other utilities in accordance with the plans and details. Any conflicts between utilities are to be resolved with the involvement and approval of the engineer.

10. Install inlet protection at all catch basins as they are constructed, in accordance with the details.

11. All swales and drainage structures are to be constructed and stabilized prior to having runoff directed to them.

12. Daily, or as required, construct temporary berms, drainage ditches, check dams, sediment traps, etc., to prevent erosion on the site and prevent any siltation of abutting waters and/or property.

13. Perform final fine grading, including placement of any "select" subgrade materials.

14. Pave all parking lots and roadways with initial base course.

15. Perform all remaining site construction (i.e. building, curbing, utility connections, etc.).

16. Loam and seed all disturbed areas and install any required sediment and erosion control facilities (i.e. riprap, erosion control blankets, etc.).

17. Finish paving all roadways and parking areas with finish course.

18. Complete permanent seeding and landscaping.

19. Remove temporary erosion control measures after seeding areas have been 85% established and site improvements are complete. Smooth and re-vegetate all disturbed areas.

20. Clean site and all drainage structures, pipes, and sumps of all silt and debris.

21. Install all painted pavement markings and signage per the plans and details.

22. Upon completion of construction, it is the responsibility of the contractor to notify any relevant permitting agencies that the construction has been finished in a satisfactory manner.

4.9 Temporary Erosion Control Measures

1. The smallest practical area of land shall be exposed at any one time. At no time shall an area in excess of that required for construction be exposed.

2. Erosion, sediment and detention measures shall be installed as shown on the plans and at locations as required, or directed by the engineer.

3. All disturbed areas (including pond areas below the proposed waterline) shall be returned to proposed grades and elevations. Disturbed areas shall be loamed with a minimum of 6" of loam and seeded with seed mixture "C" at a rate not less than 1.10 pounds of seed per 1,000 square feet of area (48 lbs. per acre).

4. Silt fences and other barriers shall be inspected every seven days and within 24 hours of a rainfall of 0.5" or greater. All damaged areas shall be repaired, and sediment deposits shall periodically be removed and properly disposed of.

5. After all disturbed areas have been stabilized, the temporary erosion control measures are to be removed and the area disturbed by the removal smoothed and revegetated.

6. Areas must be seeded and mulched within 3 days of final grading, or temporarily stabilized within 14 days of initial disturbance of soil.

7. All proposed vegetated areas not stabilized by or are disturbed after October 15th must be protected with North American Green S75 erosion control blankets (or an equivalent approved in writing by the engineer) and seeded with winter rye or oats at a rate of 2.50 pounds per 1,000 square feet of area (108.90 lbs. per acre). Unstabilized swales shall be protected with erosion control blankets appropriate to the design flow conditions and seeded to the same specification. Placement of blankets shall not occur over accumulated snow.

8. An area shall be considered stable if one of the following has occurred:
   a. Base course gravels have been installed in areas to be paved;
   b. A minimum of 85% vegetated growth has been established;
   c. A minimum of 3" or non-erosive material such as stone or riprap has been installed; or
   d. Erosion control blankets have been properly installed.

9. After November 15th where work has stopped for the season, incomplete roadway or parking surfaces shall be protected with a minimum of 3" of crushed gravel meeting NHDOT Item 304.3.

10. In order to ensure the stability of the site and effective implementation of the sediment and erosion control measures specified in the plans for the duration of construction, the contractor shall be in strict compliance with the inspection and maintenance requirements to those called for in the SWPPP.

## 4.10 Inspection and Maintenance Schedule

### 4.26.1 Temporary Best Management Practices

*Silt Fencing*

During the construction process, all silt fencing will be inspected during and after storm events to ensure that the fence still has integrity and is not allowing sediment to pass. Any section of fence that has failed or is failing is to be replaced immediately, overlapping adjacent fence sections by at least one foot. If the problem persists, measures such as additional fencing (i.e. double) or the addition of hay-bales on the project side of the fence line should be considered. Sediment is to be removed from behind the fencing if found to be deeper than six inches and disposed of properly.

*Swales*

Sediment build-up in swales will be removed if it is deeper than six inches and disposed of properly.

*Sediment Traps*

Sediment traps are to be inspected once per week and after every precipitation event. Sediment is to be removed from the traps if it is deeper than six inches and disposed of properly. The lip of the outlet crest should be maintained so as to provide an even, level edge so as to promote sheet flow out of the structure so as to minimize the potential for erosion downstream form the structure. Any erosion must be repaired and stabilized immediately.

### 4.26.2 Permanent Best Management Practices

*Catch Basins*

Sediment and debris is to be removed from catch basin sumps semi-annually (as well as from sumps below the inlet of culverts). Grease hoods are to be wiped clean and the rags disposed of properly. Debris obscuring the grate inlet should also be removed.

*Drainage Swales*

Sediment build-up in swales is to be removed if it is deeper than six inches, and any debris also removed. Areas where vegetation has not become established or has died should be reseeded. If this fails, additional loam and seed may be required. *Fertilizers should be utilized only as a last resort.* Mowing should be performed at least once a year, but not shorter than four inches, and all grass clippings removed.

## 5.0 CONCLUSION

This proposed site development located on Lafayette Road and Ocean Road in Portsmouth, NH will have minimal adverse effect on abutting infrastructures or properties by way of stormwater runoff or siltation. Appropriate steps will be taken to eliminate erosion and sedimentation; these will be accomplished through the construction of a drainage system consisting of site grading, curbing, catch basins with sedimentation sumps and subsurface detention. The use of Best Management Practices developed by the State of New Hampshire have been utilized in the design of this system and their application will be enforced throughout the construction process.

A site specific, terrain alteration permit (RSA 485:A-17) is not required for this site plan due to the area of disturbance being less than 100,000 square-feet.

## MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Rockingham County, New Hampshire
Survey Area Data: Version 21, Sep 16, 2019

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Dec 31, 2009—Jun 14, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.
