Findings of Fact | Wetland Conditional Use Permit City of Portsmouth Planning Board

Date: <u>April 17, 2025</u> Property Address: <u>56 Ridges Ct.</u> Application #: <u>LU-25-13</u> Decision: Approve Deny

□ Approve with Conditions

Findings of Fact:

Per RSA 676:3, I: The local land use board shall issue a final written decision which either approves or disapproves an application for a local permit and make a copy of the decision available to the applicant. The decision shall include specific written findings of fact that support the decision. Failure of the board to make specific written findings of fact supporting a disapproval shall be grounds for automatic reversal and remand by the superior court upon appeal, in accordance with the time periods set forth in RSA 677:5 or RSA 677:15, unless the court determines that there are other factors warranting the disapproval. If the application is not approved, the board shall provide the applicant with written reasons for the disapproval. If the application of all conditions necessary to obtain final approval.

In order to grant Wetland Conditional Use permit approval the Planning Board shall find the application satisfies criteria set forth in the Section 10.1017.50 (Criteria for Approval) of the Zoning Ordinance.

1	Zoning Ordinance Sector 10.1017.50 Criteria for Approval 1. The land is reasonably suited to the use activity or alteration.	Finding (Meets Criteria for Approval) Meets Does Not Meet	Supporting Information This project proposes the removal of existing structures and pavement from the wetland buffer with the installation of new structures and a driveway within the buffer but further away from the resource. The majority of the work is within the wetland buffer.
2	2. There is no alternative location outside the wetland buffer that is feasible and reasonable for the proposed use, activity or alteration.	Meets Does Not Meet	The majority of the work is proposed within the 100' wetland buffer and includes new structures in the buffer but an overall reduction in impervious surfaces. The proposed shed and deck are slightly further from the wetland but not outside of the buffer.

	Zoning Ordinance Sector 10.1017.50 Criteria for Approval	Finding (Meets Criteria for Approval)	Supporting Information
3	3. There will be no adverse impact on the wetland functional values of the site or surrounding properties.	Meets Does Not Meet	This project proposes the removal of four existing trees and one shrub within the buffer and the addition of six highbush blueberries and an 1,100 s.f. naturalized area in a portion of the 25' no-cut buffer. Some improvement to the wetland functional values as they exist today appear to be proposed. Proper care and maintenance of the wetland and wetland buffer would prevent adverse impacts. This should include no longer mowing the wetland resource. In addition, the applicant should come into compliance with the City's 25' no-cut vegetative buffer regulations.
4	4. Alteration of the natural vegetative state or managed woodland will occur only to the extent necessary to achieve construction goals.	Meets Does Not Meet	This project proposes the removal of some existing vegetation to achieve construction goals and proposes replacement with blueberries and a small portion of the 25' no-cut buffer to be naturalized. Property owners have historically altered the vegetative state of a portion of the wetland and the entire 25' buffer through regular mowing. Staff suggest this practice ceases to comply with the vegetative buffer strip standards.
5	5. The proposal is the alternative with the least adverse impact to areas and environments under the jurisdiction of this section.	Meets Does Not Meet	The proposed project will impact approximately 8,800 SF of land area within the wetland buffer. All of the impacts will be within previously developed areas that are either lawn, building, or driveway. The design approach avoids impacting natural areas. The house addition is placed as close to the front lot line as reasonably possible and remains compliant with the zoning ordinance and provides natural flow of the interior of the existing house to the addition and garage, while providing adequate space for parking in the driveway for visitors as Ridges Court is narrow and has limited opportunities for street parking.
6	6. Any area within the vegetated buffer strip will be returned to a natural state to the	Meets Does Not	The large wetland lawn will be allowed to revert to a natural state. The 25-foot no cut buffer will be limited to two cuttings per year. The benefits of the improved

	Zoning Ordinance Sector 10.1017.50 Criteria for Approval	Finding (Meets Criteria for Approval)	Supporting Information
	extent feasible.	Meet	stormwater management system, moving the impervious areas away from the resource and enhancing the wetland system and buffer meet the spirit and intent of the Ordinance.

March 25, 2025

Rick Chellman, Chairman Portsmouth Planning Board City of Portsmouth Municipal Complex 1 Junkins Avenue Portsmouth, New Hampshire 03801

Re: Application for Conditional Use Permit Assessor's Map 207, Lots 63, 68 & 69 56 Ridges Court Altus Project No. 5639

Dear Mr. Chellman,

On behalf of Annemarie (Annie) and Michael Rainboth, Trustees of the Rainboth Revocable Trust of 2010, Altus Engineering LLC (Altus) and the design team are pleased to submit an application for a Conditional Use Permit to the Planning Board. Annie and Michael own the property located at 56 Ridges Court. They currently live a few houses away on the corner of Ridges Court and New Castle Avenue. They intend to renovate and expand the existing home.

The entire neighborhood was constructed prior to City wetland buffer regulations. Portions of the lot are within the NHDES 100-foot tidal buffer and the 250-foot Shoreland Buffer. No improvements are proposed within 100 feet of the highest observable tide line. A permit from the NHDES Shoreland program will be required.

The existing garage and shed will be razed. A garage addition with living space above is proposed along with a new shed. The structures will be further from the resource area than the existing buildings. Stormwater management improvements are proposed to enhance the wetland buffer.

On March 12, 2025, the Conservation Commission voted to recommend approval of the application with stipulations. Altus, working with the Rainboth's, have revised the application package to address the recommendations of the Commission.

- 1. The on-site wetland system that is maintained as a lawn will no longer be mowed and will naturalize.
- 2. The 25-foot no cut buffer adjacent to the wetland will be limited to two cuttings per year.

- 3. Wetland boundary markers will be installed along the 25-foot no cut buffer and along the wetland boundary at 50-foot intervals. Boundary markers will be installed prior to the commencement of earthwork activities.
- 4. Boulders, trees, or other natural features will be placed in between the proposed trees to create a physical barrier along the edge of the wetland.
- 5. A maintenance plan was submitted with the original submission to the Conservation Commission. It has been augmented to include Best Management Practices for mowing the wetland buffer.

Enclosed for the Planning Board's consideration please find the following:

- Letter of Authorization
- Conditional Use Permit Narrative (revised)
- Wetland Buffer Function and Values Assessment (Noel)
- Conditional Use Permit Application Checklist
- Drainage computations
- Stormwater O & M manual (revised)
- Project Site Plans (revised)

Please feel free to call or email me directly should you have any questions or need any additional information.

Sincerely,

ALTUS ENGINEERING, LLC

CONDITIONAL USE PERMIT APPLICATION 56 RIDGES COURT NARRATIVE Revised March 2025

On behalf of the Applicant, Annemarie (Annie) and Michael Rainboth and the Rainboth Revocable Trust of 2010, Altus Engineering, LLC (Altus) respectfully submits a Wetlands Conditional Use Permit application for the expansion of a single-family residence at 56 Ridges Court. Annie and Mike propose to retain, renovate, and expand the 100-year-old home and raze the existing outbuildings.

The home is sited on Tax Map 207, Lot 63. Two additional vacant parcels, Tax Map 207 Lots 68 and 69, are contiguous to the Rainboth's future home. The vacant lots appear to have frontage on a paper street. For the basis of the computations, all three lots being contiguous are included.

The southeast corner of the parcel lies within the 100-foot tidal buffer. We are proposing to avoid impacting the tidal buffer. The southeastern portion of the lot is a freshwater wetland. The 100-foot buffer from the wetland encompasses a significant portion of the lot, making redevelopment of any sort nearly impossible without a Conditional Use Permit. The majority of the on-site wetland is maintained as lawn.

The house was constructed prior to City wetland buffer regulations and before most zoning ordinances were enacted. Based on the topography adjacent to the existing driveway, it appears that portions of the lot were regraded and filled.

The existing garage is over 80-feet from Ridges Court requiring a long driveway and turnaround area. The expanded attached garage with living space above will be sited closer to the street, reducing the driveway substantially.

The built infrastructure will be sited further from the resource area than the current buildings and pavement. Stormwater management treatment will be provided where none currently exists. The Rainboth's are good stewards of the land and are proposing to follow the recommendations of the Conservation Commission. They will allow the wetlands that are maintained as lawn to naturalize. They are also committed to allowing the 25-foot no cut wetland buffer to be minimally maintained. It will be mowed only twice a year. They are committed to avoiding the use of herbicides, pesticides, and fertilizers in the wetlands and across their whole property. In accordance with Article 10 Environmental Protection Standards Section 10.1010 Wetland Protect, the redevelopment will require a Conditional Use Permit from the Planning Board. The project does not require any additional relief from the City of Portsmouth Zoning Ordinance. Per Section 10.1017.50 for criteria for approval of a Conditional Use Permit, Altus offers the following:

(1) The land is reasonably suited to the use, activity, or alteration.

The property is within the SRB Zoning District, a residential zone. All of the abutting properties are residential. The parcel has been used as a single-family residence for nearly 100-years and will continue to do so. The minimum lot size in the zoning district is 15,000 SF. The existing lot is 20,585 SF in area. Consolidated, the lot will exceed 30,000 SF, enough land to subdivide the land into two parcels.

The existing home is served by municipal water supply and is connected to the municipal sewage collection system. Commercial use of the property is not allowed. As such, the only viable use of the property is a single-family residence.

(2) There is no alternative location outside the wetland buffer that is feasible and reasonable for the proposed use, activity, or alteration.

Consolidated, the 30,962 SF parcel exceeds the minimum lot size for the zoning district. Only 3,550 SF of the lot is not within the wetland buffer and the majority of that area is within the front and side yard setbacks which are not buildable by right or are sited in the rear of the lot requiring a long access drive across the buffer for access. Only 725 SF of the lot exclusive of the existing building is viable for development without obtaining a variance or conditional use permit.

Thus, there is very little viable building envelope that meets both the zoning setbacks and is outside the wetland buffer area. The development proposed is sited as far from the resource area as reasonably possible. The Rainboth's are taking advantage of retaining the existing home and expanding it. Due to the layout of the existing structure and the desire to have a two-bay garage, the addition needs to be attached to the rear of the home and then will extend south to provide access to the garage.

(3) There will be no adverse impact on the wetland functional values of the site or surrounding properties;

The majority of the on-site wetland system is maintained as lawn and has been for several decades.

Along the property line, the wetland transitions to a natural environment with scrub growth. The wetland/lawn encompasses 6,100 SF. The lawn/wetland will be allowed to naturalize. This will improve the functions as a stormwater filter, natural detention, and moderate the velocity of runoff discharging from the neighborhood.

Currently upgradient of the wetland is the house, garage/shed, and large paved driveway. The existing expansive driveway is within 32-feet of the wetlands. The building and pavement will be moved further from the wetland. The proposed deck, which will be permeable beneath, will be 51.5 feet from the wetland. Drip edges will be installed on the west side of the building to promote infiltration, reduce the rate of runoff, and provide treatment. Runoff from the east and north side of the building will be captured in gutters and will be directed to the infiltration system beneath the deck. The portion of the driveway within the wetland buffer will be constructed using permeable materials, either pavement or pavers. Runoff from the impervious portion of the new driveway will be routed across the lawn through a swale that will treat, reduce the velocity, and reduce runoff temperature before discharge into the wetland.

Stormwater quantity will be enhanced and volume and peak rate of runoff discharging from the site will be reduced.

The site effective impervious area will be slightly reduced in both the wetland buffer and the entire lot, as we are taking advantage of the area beneath the deck to provide groundwater recharge and infiltration.

(4) Alteration of the natural vegetative state or managed woodland will occur only to the extent necessary to achieve construction goals; and

The entire redevelopment project will be within areas that have previously been altered. Five trees and shrubs within the buffer will be removed. To offset the removal, 5 new wetland tolerant trees will be planted. Additionally, a $\pm 1,100$ SF portion of the existing lawn in the wetland buffer will be allowed to naturalize and will no longer be maintained as lawn. 6-high bush blueberry plants will be installed at the end of the swale adjacent to the wetlands. The wetland lawn will naturalize and the 25-foot no cut buffer will be limited to two cuttings per year.

(5) The proposal is the alternative with the least adverse impact to areas and environments under the jurisdiction of this Section.

The proposed project will impact approximately 8,800 SF of land area within the wetland buffer. All of the impacts will be within previously developed areas that are either lawn, building, or driveway. The design approach avoids impacting

natural areas. The house addition is placed as close to the front lot line as reasonably possible and remain compliant with the zoning ordinance and provide natural flow of the interior of the existing house to the addition and garage, while providing adequate space for parking in the driveway for visitors as Ridges Court is narrow and has limited opportunities for street parking.

(6) Any area within the vegetated buffer strip will be returned to a natural state to the extent feasible.

The large wetland lawn will be allowed to revert to a natural state. The 25-foot no cut buffer will be limited to two cuttings per year. The benefits of the improved stormwater management system, moving the impervious areas away from the resource and enhancing the wetland system and buffer meet the spirit and intent of the Ordinance.

January 22, 2025

Mr. Eric Weinrieb, P.E. Altus Engineering 133 Court Street Portsmouth, New Hampshire 03801

RE: 56 Ridges Court, Portsmouth, New Hampshire, JWN #23-142

Dear Eric:

Per your request, the following information is provided to assist you in the Conditional Use Permit Application requirements. Specifically, Section 10.101722(3) of the City Of Portsmouth, New Hampshire Zoning Ordinance.

The wetland delineation was conducted on December 21, 2023 (both tidal and freshwater wetlands). The delineation was conducted in accordance with the U.S. Army Corps of Engineers document *Corps of Engineers Wetlands Delineation Manual*, (1987) along with the required *Regional Supplement to the Corps of Engineers Wetland Delineation Manual*: *Northcentral and Northeast Region*, (Version 2, January 2012). The wetland boundary was located by North Easterly Surveying. Mr. Marc Jacobs, Wetland Scientist #010, reviewed and confirmed the wetland delineation on February 20, 2024. The attached FEMA 100 year flood and extended flood hazard map from the town GIS database for the properties more closely represents the existing wetland system compared to other available resource maps.

The proposed project will not encroach into the 100 foot buffer of the tidal system (refer to photo of adjacent off-site tidal system). The freshwater wetland where buffer encroachment will occur is approximately an acre in size and would classify as a wet meadow with poorly drained soils. The portion of the delineated wetland on the subject properties is essentially a mowed lawn with some scattered sedges within the yard(s) and one large willow (*Salix sp.*). A few scattered willows were noted in the wetland off-site as well. An on-site was conducted on January 16, 2025 to collect data on the plants within the more natural portion of the wetland that was within the paper road. This area had been recently cut and there was not enough vegetation left to classify most of the herbaceous layer (refer to photo – the more snow covered areas are maintained paths within the wetland). Adjacent to the property line of 56 Ridges Court the few shrubs that were observed included: common buttonbush (*Cephalanthus occidentalis*), rambler rose (*Rosa multiflora*), glossy false buckthorn (*Frangula alnus*), European buckthorn (*Rhamnus cathartica*), and honeysuckle (*Lonicera sp.*). On the property, the only invasive plant was some

bittersweet (Celastrus sp.) that was growing in the garden with the planted blackberries (Rubus sp.). Per Altus Engineering "Site Preparation Plan" they plan to remove miscellaneous garden area features where the bittersweet is growing. The bittersweet should be carefully removed and properly disposed of. A request from the Natural Heritage Bureau (NHB) was conducted and no rare species or exemplary natural communities were documented on the property (refer to attachment). There was a NHB record nearby but the NHB determined the proposed project will not impact the NHB record (detailed information on the NHB record was not supplied). During the wetland flagging of the tidal wetland, Jesuits-bark (Iva frutescens) that is a state listed "Threatened" species was observed by the undersigned. These shrubs are off-site and will not be impacted by the proposed development.

A formal functions and values assessment is not required per Section 10.1017.22 of the City Of Portsmouth, New Hampshire Zoning Ordinance. Using professional judgement, the performance of the functions and values would be low due to: relatively small wetland size (1+/- acre), wetland is disturbed/routinely cut so vegetation is not diverse, subtle ditching within the wetland lowers the ability to store and slowly release water, and existing buffers around the wetland are developed with residential homes. This wet meadow is still of importance due to the nearby downstream tidal wetland system. Refer to Altus Engineering stormwater plan for details on protecting the wet meadow system from increased runoff, etc.

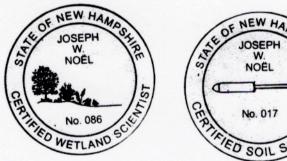

The proposed redevelopment of the property will reduce the driveway size, relocated the garage and the attached garden shed further from the wet meadow. There will be a proposed addition, new deck, etc. Refer to Altus Engineering plans for details on the existing versus proposed plans for the property. The impervious surface will increase with the proposed redevelopment of the property (refer to Altus Engineering plans for existing and proposed impervious surface area, and proposed effective impervious area figures). Per Altus Engineering, the compensation proposed is to consolidate Lot 68 & 69 with Lot 63. Plantings are discussed by Altus Engineering to offset the removal of trees and shrubs in the uplands. The actual plantings and locations will be determined by a landscape designer.

I hope this information is sufficient in the review of the proposed project. Please feel free to call with any questions.

Sincerely,

Jonk W. Nil

Location: Portsmouth 56 Ridges Court

Project

Description: Proposed addition to the house, deck, and shed.

The NH Natural Heritage database has been checked by staff of the NH Natural Heritage Bureau and/or the NH Nongame and Endangered Species Program for records of rare species and exemplary natural communities near the area mapped below. The species considered include those listed as Threatened or Endangered by either the state of New Hampshire or the federal government.

It was determined that, although there was a NHB record (e.g., rare wildlife, plant, and/or natural community) present in the vicinity, we do not expect that it will be impacted by the proposed project. This determination was made based on the project information submitted via the NHB Datacheck Tool on 1/6/2025 5:30:44 P.M, and cannot be used for any other project.

Based on the information submitted, no further consultation with the NH Fish and Game Department pursuant to Fis 1004 is required.

Wetland Conditional Use Permit Application Checklist

This wetland conditional use permit application checklist is a tool designed to assist the applicant in the planning process and for preparing the application for Conservation Commission and Planning Board review. The checklist is required to be uploaded as part of your wetland conditional use permit application to ensure a full and complete application is submitted to the Planning and Sustainability Department and to the online portal. A pre-application conference with a member of the Planning and Sustainability Department is encouraged as additional project information may be required depending on the size and scope of the project. The applicant is cautioned that this checklist is only a guide and is not intended to be a complete list of all wetland conditional use permit requirements. Please refer to Article 10 of the City of Portsmouth Zoning Ordinance for full details.

Applicant Responsibilities: Applicable fees are due upon application submittal to the Planning Board (no fees are required for Conservation Commission submission). The application will be reviewed by Planning and Sustainability Department staff to determine completeness. Incomplete applications which do not provide required information for the evaluation of the proposed site development shall not be provided review by the Conservation Commission or Planning Board.

Narrative

PROJECT DESCRIPTION

The Trustees of the Rainboth Revocable Trust of 2010 are proposing to construct an addition to the existing home, a new driveway and a shed located at 56 Ridges Court Portsmouth, New Hampshire. The 0.71-acre property is identified as Tax Map 207, Lots 63, 68, and 69 and is located in the Single Residence-B District. The site is currently developed as a single-family residence. Access to the development site is via a driveway coming off Ridges Court.

The proposed project will construct a new addition, driveway, and shed. The house is serviced by municipal water and sewer. The proposed stormwater management system includes stone drip edges, a stone infiltration basin, and vegetative swales. These will mitigate and improve the storm water quality leaving the property.

Site Soils/Wetlands

Based off data from the USDA National Resources Conservation Service Web Soil Survey, the site sits on 799 Urban land-Canton complex soils. Altus recognizes these soils as HSG B and C except for the wetland which we categorized as HSG D based on poor infiltration capacity. Joseph W. Noel, Wetland Scientist, completed an on-site inspection on December 21, 2023, and identified a freshwater wetland greater than 10,000 square feet. This finding was confirmed by Wetlands Scientist, Marc Jacobs.

Pre-Development (Existing Conditions)

The site currently features a single-family home with a deck, detached shed, and paved driveway. Stormwater is collected in gutters around the home and is conveyed towards the wetland. The site generally slopes in a westerly direction towards the delineated wetland. Hydrology is characterized by two existing sub-catchments as delineated on the accompanying "Pre-Development Watershed Plan". Site runoff was analyzed at two points of analysis (POA). POA #1 is on the northern border of the property and POA #2 is in the southwest corner of the property under the wetland.

Post-Development (Proposed Conditions)

The site plan features the addition to the existing house as well as the new driveway and proposed shed.

The post-development conditions were analyzed at the same discharge point as the predevelopment conditions. The post-development watersheds are delineated on the accompanying "Post-Development Watershed Plan". Modifications to the delineated areas and associated ground cover were made to sub-catchments to account for the improvements to the property. As shown on the attached Post-Development Watershed Plan, the site was divided into seven postdevelopment sub-catchment areas. The same points of analysis in the Pre-Development model were used for comparison of the Pre- and Post-development conditions.

The Post-Development Watershed Plan illustrates the proposed stormwater management system. Site topography, existing features, proposed site improvements, proposed grading, drainage and erosion control measures are shown on the accompanying plans. Recommended erosion control measures are based upon the December 2008 edition of the "*New Hampshire Stormwater Manual Volumes 1 through 3*" prepared by NHDES and Comprehensive Environmental, Inc. as amended.

CALCULATION METHODS

The drainage study was completed using the USDA SCS TR-20 Method within the HydroCAD Stormwater Modeling System. Reservoir routing was performed with the Dynamic Storage Indication method with automated calculation of tailwater conditions. A Type III 24-hour rainfall distribution was utilized in analyzing the data for the 2, 10, 25 and 50 year - 24-hour storm events using rainfall data provided by the Northeast Regional Climate Center (NRCC). 15% was added to each storm event's rainfall data as required in the city or Portsmouth site plan review regulations. A time span of 0 to 24 hours was analyzed at 0.01-hour increments. Infiltration rates are based on the K_{sat} Values for New Hampshire soils.

Drainage Analysis

A complete summary of the drainage model is included in the appendix of this report. The following table compares pre- and post-development peak rates at the Points of Analysis identified on the plans for the 2, 10, 25 and 50-year storm events:

	2-Yr Storm	10-Yr Storm	25-Yr Storm	50-Yr Storm
	(3.69 inch)	(5.59 inch)	(7.10 inch)	(8.50 inch)

Stormwater Modeling Summary Peak Q (cfs) for Type III 24-Hour Storm Events

As the above table demonstrates, the proposed peak rates of runoff at the point of analysis will be decreased or unchanged from the existing conditions for all analyzed storm events.

CONCLUSION

This proposed site redevelopment of property located at 56 Ridges Court Portsmouth, New Hampshire will have no adverse effect on abutting properties as a result of stormwater runoff or siltation. Post-construction peak rates of runoff from the site will be lower than or the same as the existing conditions for all analyzed storm events. The new stormwater management system will also provide appropriate treatment to runoff from the proposed on-site impervious surfaces. Appropriate steps will be taken to properly mitigate erosion and sedimentation using temporary and permanent Best Management Practices for sediment and erosion control.

Disclaimer

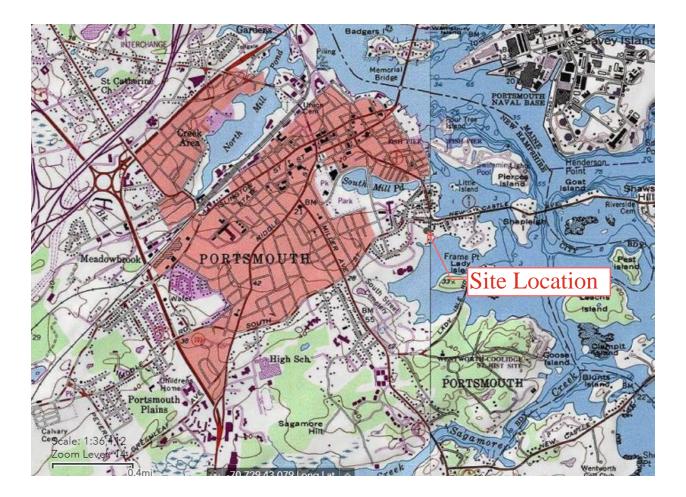

Altus Engineering, notes that stormwater modeling is limited in its capacity to precisely predict peak rates of runoff and flood elevations. Results should not be considered to represent actual storm events due to the number of variables and assumptions involved in the modeling effort. Surface roughness coefficients (n), entrance loss coefficients (ke), velocity factors (kv) and times of concentration (Tc) are based on subjective field observations and engineering judgment using available data. For design purposes, curve numbers (Cn) describe the average conditions. However, curve numbers will vary from storm to storm depending on the antecedent runoff conditions (ARC) including saturation and frozen ground. Also, higher water elevations than predicted by modeling could occur if drainage channels, closed drain systems or culverts are not maintained and/or become blocked by debris before and/or during a storm event as this will impact flow capacity of the structures. Structures should be re-evaluated if future changes occur within relevant drainage areas in order to assess any required design modifications.

NRCS Soils Report

United States Department of Agriculture

Natural Resources Conservation Service A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants Custom Soil Resource Report for Rockingham County, New Hampshire

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/? cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

Custom Soil Resource Report Soil Map

Γ

MAP INFORMATION The soil surveys that comprise your AOI were mapped at 1:24,000.	Warning: Soil Map may not be valid at this scale. Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.	Please rely on the bar scale on each map sheet for map measurements. Source of Map: Natural Resources Conservation Service Web Soil Survey URL: Coordinate System: Web Mercator (EPSG:3857)	Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required. This product is consisted from the LISDA MDCS contribut data as	of the version date(s) listed below. Soil Survey Area: Rockingham County, New Hampshire Survey Area Data: Version 27, Sep 3, 2024	Soil map units are labeled (as space allows) for map scales 1:50,000 or larger. Date(s) aerial images were photographed: Jun 19, 2020—Sep 20, 2020	The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however,

onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Rockingham County, New Hampshire

799—Urban land-Canton complex, 3 to 15 percent slopes

Map Unit Setting

National map unit symbol: 9cq0 Elevation: 0 to 1,000 feet Mean annual precipitation: 42 to 46 inches Mean annual air temperature: 45 to 48 degrees F Frost-free period: 120 to 160 days Farmland classification: Not prime farmland

Map Unit Composition

Urban land: 55 percent *Canton and similar soils:* 20 percent *Minor components:* 25 percent *Estimates are based on observations, descriptions, and transects of the mapunit.*

Description of Canton

Setting

Parent material: Till

Typical profile

Stormwater Operations & Maintenance Plan

STORMWATER INSPECTION AND MAINTENANCE MANUAL

Trustees of Rainboth Revocable Trust of 2010 Tax Map 207, Lots 63, 68, and 69 56 Ridges Court Portsmouth, NH March 2025

OWNER: Trustees of Rainboth Revocable Trust of 2010 122 New Castle Avenue Portsmouth, NH 03801

Proper inspection, maintenance, and repair are key elements in maintaining a successful stormwater management program on a developed property. Routine inspections ensure permit compliance and reduce the potential for deterioration of infrastructure or reduced water quality. The following responsible parties shall be in charge of managing the stormwater facilities:

RESPONSIBLE PARTIES:

Owner:	Michael and Annemarie Rainboth		603-431-199 <u>3</u>	
	Name	Company	Phone	
Inspection:	Michael and Anne	emarie Rainboth	603-431-1993	
-	Name	Company	Phone	
Maintenance	e: Michael and Anno	emarie Rainboth	603-431-199 <u>3</u>	
	Name	Company	Phone	
NOTES				

<u>NOTES:</u>

Written inspection forms and maintenance logs shall be completed yearly by a qualified inspector retained by the owner or assigns.

Photographs of each stormwater BMP are to be taken at each inspection and submitted with the annual inspection reports.

Inspection and maintenance responsibilities shall transfer to any future property owner(s).

This manual shall be updated as needed to reflect any changes related to any transfer of ownership and/or any delegation of inspection and maintenance responsibilities to another entity

INFILTRATION BASINS

Function – Infiltration basins and tree box filters provide treatment to runoff prior to directing it to stormwater systems by filtering sediment and suspended solids, trapping them in the bottom of the facility and in the filter media itself. Additional treatment is provided by the native water-tolerant vegetation which removes nutrients and other pollutants through bio-uptake. Stormwater detention and infiltration can also be provided as the filtering process slows runoff, decreases the peak rate of discharge and promotes groundwater recharge.

Infiltration basin and tree box filters shall be managed (Per AGR 3800 and RSA 430:53) to: prevent and control the spread of invasive plant, insect, and fungal species; minimize the adverse environmental and economic effects invasive species cause to agriculture, forests, wetlands, wildlife, and other natural resources of the state; and protect the public from potential health problems attributed to certain invasive species.

Maintenance

- Inspect bi-annually and after significant rainfall events.
- If an infiltration basin or tree box filter does not completely drain within 72-hours following a rainfall event, then a qualified professional shall be retained to assess the condition of the facility to determine measures required to restore its filtration and/or infiltration function(s), including but not limited to removal of accumulated sediments and/or replacement or reconstruction of the filter media. Filter media shall be replaced with material matching the specification on the design drawings or the NHDES Stormwater Manual.
- Replace any riprap dislodged from spillways, inlets and outlets.
- Remove any obstructions, litter and accumulated sediment or debris as warranted but no less than once a year.
- Mowing of any grassed area in or adjacent to a raingarden or tree box filter, including any berms, shall be performed at least twice per year (when areas are not inundated) to keep the vegetation in vigorous condition. The cut grass shall be removed to prevent the decaying organic litter from clogging the filter media or choking other vegetation.
- Select vegetation should be maintained in healthy condition. This may include pruning, removal and replacement of dead or diseased vegetation.
- Remove any invasive species, Per AGR 3800 and RSA 430:53.
- Remove any hard wood growth aside from trees in tree box filters.
- Replace media in tree box filters when replacing tree.

CULVERTS AND DRAINAGE PIPES

Function – Culverts and drainage pipes convey stormwater away from buildings, walkways, and parking areas and to surface waters or closed drainage systems.

Maintenance

• Culverts and drainage pipes shall be inspected semi-annually, or more often as needed, for accumulation of debris and structural integrity. Leaves and other debris shall be removed from the inlet and outlet to insure the functionality of drainage structures. Debris shall be disposed of on site where it will not concentrate back at the drainage structures or at a solid waste disposal facility.

• Riprap Areas - Culvert outlets and inlets shall be inspected during annual maintenance and operations for erosion and scour. If scour or creek erosion is identified, the outlet owner shall take appropriate means to prevent further erosion. Increased lengths of riprap may require a NHDES Permit and/or local permit.

CATCH BASINS/YARD DRAINS

Function – Catch basins and field drains collect stormwater, primarily from paved surfaces and roofs. Stormwater from paved areas often contains sediment and contaminants. Sumps serve to trap sediment, trace metals, nutrients and debris. Hooded catch basins trap hydrocarbons and floating debris.

Maintenance

- Remove leaves and debris from structure grates on an as-needed basis.
- Sumps shall be inspected and cleaned annually and any removed sediment and debris shall be disposed of at a solid waste disposal facility.

RIP RAP OUTLETS, SWALES AND PLUNGE POOLS

Function – Rip rap outlets slow the velocity of runoff, minimizing erosion and maximizing the treatment capabilities of associated buffers. Vegetated buffers, either forested or meadow, slow runoff which promotes and reduces peak rates of runoff. The reduced velocities and the presence of vegetation encourage the filtration of sediment and the limited bio-uptake of nutrients.

Maintenance

- Inspect riprap, level spreaders and buffers at least annually for signs of erosion, sediment buildup, or vegetation loss.
- Inspect level for signs of condensed flows. Level spreader and rip rap shall be maintained to disperse flows evenly over level spreader.
- If a meadow buffer, provide periodic mowing as needed to maintain a healthy stand of herbaceous vegetation.
- If a forested buffer, then the buffer should be maintained in an undisturbed condition, unless erosion occurs.
- If erosion of the buffer (forested or meadow) occurs, eroded areas should be repaired and replanted with vegetation similar to the remaining buffer. Corrective action should include eliminating the source of the erosion problem and may require retrofit or reconstruction of the level spreader.
- Remove debris and accumulated sediment and dispose of properly.

LANDSCAPED AREAS – FERTILIZER PROHIBITED

LANDSCAPED AREAS - LITTER CONTROL

Function – Landscaped areas tend to filter debris and contaminates that may block drainage systems and pollute the surface and ground waters.

Maintenance

- Litter Control and lawn maintenance involves removing litter such as trash, leaves, lawn clippings, pet wastes, oil and chemicals from streets, parking lots, and lawns before materials are transported into surface waters.
- Litter control shall be implemented as part of the grounds maintenance program.

VEGETATIVE SWALES

Function – Vegetative swales filter sediment from stormwater, promote infiltration, and the uptake of contaminates. They are designed to treat runoff and dispose of it safely into the natural drainage system.

Maintenance

- Timely maintenance is important to keep a swale in good working condition. Mowing of grassed swales shall be monthly to keep the vegetation in vigorous condition. The cut vegetation shall be removed to prevent the decaying organic litter from adding pollutants to the discharge from the swale.
- Fertilizing shall be bi-annual or as recommended from soil testing.
- Inspect swales following significant rainfall events.
- Woody vegetation shall not be allowed to become established in the swales or rock riprap outlet protection and if present shall be removed.
- Accumulated debris disrupts flow and leads to clogging and erosion. Remove debris and litter as necessary.
- Inspect for eroded areas. Determine cause of erosion and correct deficiency as required. Monitor repaired areas.

CONTROL OF INVASIVE PLANTS IN THE WETLANDS AND WETLAND BUFFERS

Function – Invasive plants are introduced, alien, or non-native plants, which have been moved by people from their native habitat to a new area. Some exotic plants are imported for human use such as landscaping, erosion control, or food crops. They also can arrive as "hitchhikers" among shipments of other plants, seeds, packing materials, or fresh produce. Some exotic plants become invasive and cause harm by:

- becoming weedy and overgrown;
- killing established shade trees;
- obstructing pipes and drainage systems;
- forming dense beds in water;
- lowering water levels in lakes, streams, and wetlands;
- destroying natural communities;
- promoting erosion on stream banks and hillsides; and
- resisting control except by hazardous chemical.

Maintenance

During maintenance activities, check for the presence of invasive plants and remove in a safe manner as described in the attached "Methods for Disposing Non-Native Invasive Plants" prepared by the UNH Cooperative Extension.

GENERAL CLEAN UP

- Upon completion of the project, the contractor shall remove all temporary stormwater structures (i.e., temporary stone check dams, silt fence, temporary diversion swales, catch basin inlet filter, etc.). Any sediment deposits remaining in place after the silt fence or filter barrier is no longer required shall be dressed to conform to the existing grade, prepared, and seeded. Remove any sediment in catch basins and clean drain pipes that may have accumulated during construction.
- Once in operation, all paved areas of the site should be swept at least once annually at the end of winter/early spring prior to significant spring rains.

SNOW MANANGEMENT

Snow should never be stored in any stormwater practice as it may affect functionality by blocking drains and reducing the storage volume available for runoff. The Owner/Applicant and any maintenance personnel should take great care to ensure that snow is stored only in areas depicted on the site plan and away from locations that could negatively impact drainage infrastructure or flow paths.

PERMEABLE PAVERS

Function – Porous pavement (Pavers) is designed to capture rainwater runoff containing suspended solids, nutrients and pollutants. Proper maintenance of porous pavement is crucial for ensuring its longevity and functionality to infiltrate runoff.

Maintenance

- New porous pavement shall be inspected several times in the first month after construction and at least annually thereafter. Inspections shall be conducted after major storms to check for surface ponding that might indicate possible clogging.
- Inspect annually for pavement deterioration or spalling.
- Vacuum sweeping shall be performed once a year or as needed to maintain permeability. Power washing may be required prior to vacuum sweeping to dislodge trapped particles.
- Sand and abrasives shall not be used for winter maintenance, as they will clog the pores; deicing materials shall be used instead.
- Never reseal or repave with impermeable materials. If the porous pavement is damaged, it can be repaired using conventional, non-porous patching mixes as long as the cumulative area repaired does not exceed 10 percent of the paved area.

WETLANDS BUFFER

The 25-foot wetland buffer and the edge of the delineated wetlands shall be permanently marked with plaques, boulders, and/or other suitable natural features. Wetland area shall not be maintained with the exception of removing invasive plant species as noted above. Mowing shall be limited to twice a year and may not occur between April 1st and July 1st. Vegetation shall not be cut closer than 1-inch above the ground surface. Cut vegetation may be removed as needed to

encourage regrowth. There shall be no limitation to the removal of woody plant growth with hand pruners.

SEDIMENT AND EROSION CONTROL NOTES

PROJECT NAME AND LOCATION

PROPOSED RESIDENTIAL ADDITION & SITE IMPROVEMENTS 56 RIDGES COURT PORTSMOUTH, NEW HAMPSHIRE TAX MAP 207 LOT 63, 68 & 69

LONGITUDE: -70°45'20" W LATITUDE: 43°04'10" N

OWNER / APPLICANT:

ANNEMARIE RAINBOTH, TRUSTEE & MICHAEL RAINBOTH, TRUSTEE TRUSTEES OF RAINBOTH REVOCABLE TRUST OF 2010 122 NEW CASTLE AVENUE PORTSMOUTH, NH 03801

DESCRIPTION

The project consists of the removal of a garage and the construction of an addition to a single-family residential home along with associated site improvements.

DISTURBED AREA

The total area to be disturbed for the redevelopment improvements is approximately 10,500 S.F. (±0.24 acres).

PROJECT PHASING

The proposed project will be completed in one phase

NAME OF RECEIVING WATER

The site drains overland to an unnamed wetland leading to Little Harbor.

SEQUENCE OF MAJOR ACTIVITIES

- 1. Install temporary erosion control measures including silt fences, stabilized construction entrance and inlet sediment filters as noted on the plan. All temporary erosion control measures shall be maintained in good working condition for the duration of the project.
- 2. Raze existing structures or portions thereof as shown, 3. Strip loam and stockpile.
- 4. Construct site features as shown on plan.
- 5. Rough grade site including placement of borrow materials.
- 6. Construct drainage structures, culverts, utilities & swales.
- 7. Loam (6" min) and seed all disturbed areas not paved or otherwise stabilized
- 8. Install permeable & impervious driveway.
- 9. When all construction activity is complete and site is stabilized, remove all temporary erosion control measures and any sediment that has been trapped by these devices.

TEMPORARY EROSION & SEDIMENT CONTROL AND STABILIZATION PRACTICES

All work shall be in accordance with state and local permits. Work shall conform to the practices described in the "New Hampshire Stormwater Manual, Volumes 1 - 3", issued December 2008, as amended. As indicated in the sequence of Major Activities, the silt fences shall be installed prior to commencing any clearing or grading of the site. Structural controls shall be installed concurrently with the applicable activity. Once construction activity ceases permanently in an area, silt fences and any earth/dikes will be removed once permanent measures are established.

During construction, runoff will be diverted around the site with stabilized channels where possible. Sheet runoff from the site shall be filtered through hay bale barriers, stone check dams, and silt fences. All storm drain inlets shall be provided with hay bale filters or stone check dams. Stone rip rap shall be provided at the outlets of drain pipes and culverts where shown on the drawings.

Stabilize all ditches, swales, & level spreaders prior to directing flow to them.

Temporary and permanent vegetation and mulching is an integral component of the erosion and sedimentation control plan. All areas shall be inspected and maintained until vegetative cover is These control measures are essential to erosion prevention and also reduce costly rewor of graded and shaped areas.

Temporary vegetation shall be maintained in these areas until permanent seeding is applied. Additionally, erosion and sediment control measures shall be maintained until permanent vegetation is established.

INSTALLATION, MAINTENANCE AND INSPECTION PROCEDURES FOR TEMPORARY EROSION AND SEDIMENT CONTROL MEASURES

A. GENERAL

These are general inspection and maintenance practices that shall be used to implement the plan

- 1. The smallest practical portion of the site shall be denuded at one time. 2. All control measures shall be inspected at least once each week and following any storm event
- of 0.25 inches or greater 3. All measures shall be maintained in good working order; if a repair is necessary, it will be
- initiated within 24 hours.
- 4. Built-up sediment shall be removed from silt fence or other barriers when it has reached
- one-third the height of the fence or bale, or when "bulges" occur. 5. All diversion dikes shall be inspected and any breaches promptly repaired. 6. Temporary seeding and planting shall be inspected for bare spots, washouts, and unhealthy
- 7. The owner's authorized engineer shall inspect the site on a periodic basis to review compliance with the Plans.
- 8. An area shall be considered stable if one of the following has occurred: a. Base coarse gravels have been installed in areas to be paved;
- b. A minimum of 85% vegetated growth as been established; c. A minimum of 3 inches of non-erosive material such as stone of riprap has been installed; - or -
- d. Erosion control blankets have been properly installed.
- 9. The length of time of exposure of area disturbed during construction shall not exceed 45 days. B. MULCHING

Mulch shall be used on highly erodible soils, on critically eroding areas, on areas where conservation of moisture will facilitate plant establishment, and where shown on the plans.

- 1. Timing In order for mulch to be effective, it must be in place prior to major storm
- events. There are two (2) types of standards which shall be used to assure this: a. Apply mulch prior to any storm event. This is applicable when working within 100 feet of wetlands. It will be necessary to closely monitor weather predictions, usually by contacting the National Weather Service in Concord, to have adequate warning of sianificant storms.
- b. Required Mulching within a specified time period. The time period can range from 21 to 28 days of inactivity on a area, the length of time varying with site conditions. Professional judgment shall be used to evaluate the interaction of site conditions (soil erodibility, season of year, extent of disturbance, proximity to sensitive resources, etc.) and the potential impact of erosion on adjacent areas to choose an appropriate time restriction.

INSTALLATION, MAINTENANCE AND INSPECTION PROCEDURES FOR TEMPORARY EROSION AND SEDIMENT CONTROL MEASURES (CON'T)

2. Guidelines for Winter Mulch Application -

•	Guidennes for winter Mulch	Application –
	<u>Type</u> Hay or Straw	<u>Rate per 1.000 s.f.</u> 70 to 90 lbs.
	Wood Chips or Bark Mulch	460 to 920 lbs.
	Jute and Fibrous Matting (Erosion Blanket	As per manufacturer Specifications
	Crushed Stone 1/4" to 1-1/2" dia.	Spread more than 1/2" thick
	Erosion Control Mix	2" thick (min)

3. Maintenance - All mulches must be inspected periodically, in particular after rainstorms, to check for rill erosion. If less than 90% of the soil surface is covered by mulch, additional mulch shall be immediately applied.

C. TEMPORARY GRASS COVER

- 1. Seedbed Preparation -
- to 50 percent calcium plus magnesium oxide) at a rate of three (3) tons per acre.
- 2. Seeding –
- a. Utilize annual rye grass at a rate of 40 lbs/acre. b. Where the soil has been compacted by construction operations, loosen soil to a depth of two (2) inches before applying fertilizer, lime and seed. c. Apply seed uniformly by hand, cyclone seeder, or hydroseeder (slurry including seed and fertilizer). Hydroseedings, which include mulch, may be left on soil surface. Seeding rates
- must be increased 10% when hydroseeding.
- Temporary seedings shall be periodically inspected. At a minimum, 95% of the soil surface should be covered by vegetation. If any evidence of erosion or sedimentation is apparent, repairs shall be made and other temporary measures used in the interim (mulch, filter barriers, check dams, etc.).
- D. FILTERS
- 1. Sequence of Installation -
- Sediment barriers shall be installed prior to any soil disturbance of the contributing upslope drainage area.
- 2. Maintenance -
- during prolonged rainfall. They shall be repaired if there are any signs of erosion or sedimentation below them. Any required repairs shall be made immediately. If there are signs of undercutting at the center or the edges, or impounding of large volumes of water, the sediment barriers shall be replaced with a temporary stone check dam
- b. Should the fabric on a silt fence or filter barrier decompose or become ineffective prior to the end of the expected usable life and the barrier still is necessary, the fabric shall be replaced promptly
- a. Sediment deposits must be removed when deposits reach approximately one-third (1/3) the height of the barrier
- b. Any sediment deposits remaining in place after the silt fence or other barrier is no longer required shall be removed. The area shall be prepared and seeded.
- c. Additional stone may have to be added to the construction entrance, rock barrier and riprap lined swales, etc., periodically to maintain proper function of the erosion control structure.
- E. PERMANENT SEEDING -
- 1. Bedding stones larger than $1^{1}/2^{n}$, trash, roots, and other debris that will interfere with seeding and future maintenance of the area should be removed. Where feasible, the soil should be tilled to a depth of 5" to prepare a seedbed and mix fertilizer into the soil.
- 2. Fertilizer lime and fertilizer should be applied evenly over the area prior to or at the time of seeding and incorporated into the soil. Kinds and amounts of lime and fertilizer should be based on an evaluation of soil tests. When a soil test is not available, the following minimum amounts should be applied:

Agricultural Limestone @ 100 lbs. per 1,000 s.f. 10-20-20 fertilizer @ 12 lbs. per 1,000 s.f.

3. Seed Mixture (recommended):

<u>Type</u> Tall Fescue	<u>Lbs. / Acre</u> 24	<u>Lbs</u> 0.5
Creeping Red Fescue	24	0.5
Total	48	1.1

Seed Mixture (For slope embankments): Grass Seed: Provide fresh, clean, new-crop seed complying with tolerance for purity and germination established by Official Seed Analysts of North America. Provide seed mixture composed of grass species, proportions and minimum percentages of purity, germination, and maximum percentage of weed seed, as specified:

Туре	Min. <u>Purity (%)</u>	Min. <u>Germination (%)</u>	Kg./Hectare <u>(Lbs/Acre)</u>
Creeping Red Fescue (c)	96	85	45 (40)
Perennial Rye Grass (a)	98	90	35 (30)
Redtop	95	80	5 (5)
Alsike Clover	97	90(e)	5 (5)
		Toto	al 90 (80)

- a. Ryegrass shall be a certified fine-textured variety such as Pennfine, Fiesta, Yorktown, Diplomat, or equal.
- b. Fescue varieties shall include Creeping Red and/or Hard Reliant, Scaldis, Koket, or Jamestown.

- - 3. Maintenance -

<u>Use and Comments</u> Must be dry and free from mold. May be used with plantings.

Used mostly with trees and shrub plantings.

Used in slope areas, water courses and other Control areas.

Effective in controlling wind and water erosion.

* The organic matter content is between 80 and 100%, dry weight basis. * Particle size by weight is 100% passing a 6"screen and a minimum of 70 %, maximum of 85%, passing a 0.75" screen. * The organic portion needs to be fibrous

and elongated. * Large portions of silts, clays or fine sands are not acceptable in the mix. * Soluble salts content is less than 4.0

mmhos/cm. * The pH should fall between 5.0 and 8.0.

Apply fertilizer at the rate of 600 pounds per acre of 10-10-10. Apply limestone (equivalent

a. Silt fence barriers shall be inspected immediately after each rainfall and at least daily

<u>s. / 1.000 sf</u>

INSTALLATION. MAINTENANCE AND INSPECTION PROCEDURES FOR TEMPORARY EROSION AND SEDIMENT CONTROL MEASURES (CON'T)

4. Sodding - sodding is done where it is desirable to rapidly establish cover on a disturbed area. Sodding an area may be substituted for permanent seeding procedures anywhere on site. Bed preparation, fertilizing, and placement of sod shall be performed according to the S.C.S. Handbook. Sodding is recommended for steep sloped areas, areas immediately adjacent to sensitive water courses, easily erodible soils (fine sand/silt), etc.

INSTALLATION AND MAINTENANCE:

UNACCEPTABLE INLET PROTECTION METHOD:

- 1. All proposed vegetated areas which do not exhibit a minimum of 85% vegetative growth by October 15th, or which are disturbed after October 15th, shall be stabilized by seeding and installing erosion control blankets on slopes greater than 3:1, and elsewhere seeding and placing 3 to 4 tons of mulch per acre, secured with anchored netting. The installation of erosion control blankets or mulch and netting shall not occur over accumulated snow or on frozen ground and shall be completed in advance of thaw or spring melt events;
- 2. All ditches or swales which do not exhibit a minimum of 85% vegetative growth by October 15th, or which are disturbed after October 15th, shall be stabilized temporarily with stone or erosion control blankets appropriate for the design flow conditions; and
- 3. After November 15th, incomplete road or parking surfaces where work has stopped for the winter season shall be protected with a minimum of 3 inches of crushed gravel per NHDOT Item 304.3.

<u>NOTE</u>

STORM DRAIN INLET PROTECTION

A SIMPLE SHEET OF GEOTEXTILE UNDER THE GRATE IS NOT ACCEPTABLE.

INSTALLATION: REMOVE THE GRATE FROM CATCH BASIN. IF USING OPTIONAL OIL ABSORBENTS; PLACE

ABSORBENT PILLOW IN UNIT. STAND GRATE ON END. MOVE THE TOP LIFTING STRAPS OUT OF THE WAY

MAINTENANCE: REMOVE ALL ACCUMULATED SEDIMENT AND DEBRIS FROM VICINITY OF THE UNIT AFTER

EACH STORM EVENT. AFTER EACH STORM EVENT AND AT REGULAR INTERVALS, LOOK INTO THE CATCH

BASIN INSERT. IF THE CONTAINMENT AREA IS MORE THAN 1/3 FULL OF SEDIMENT, THE UNIT MUST BE

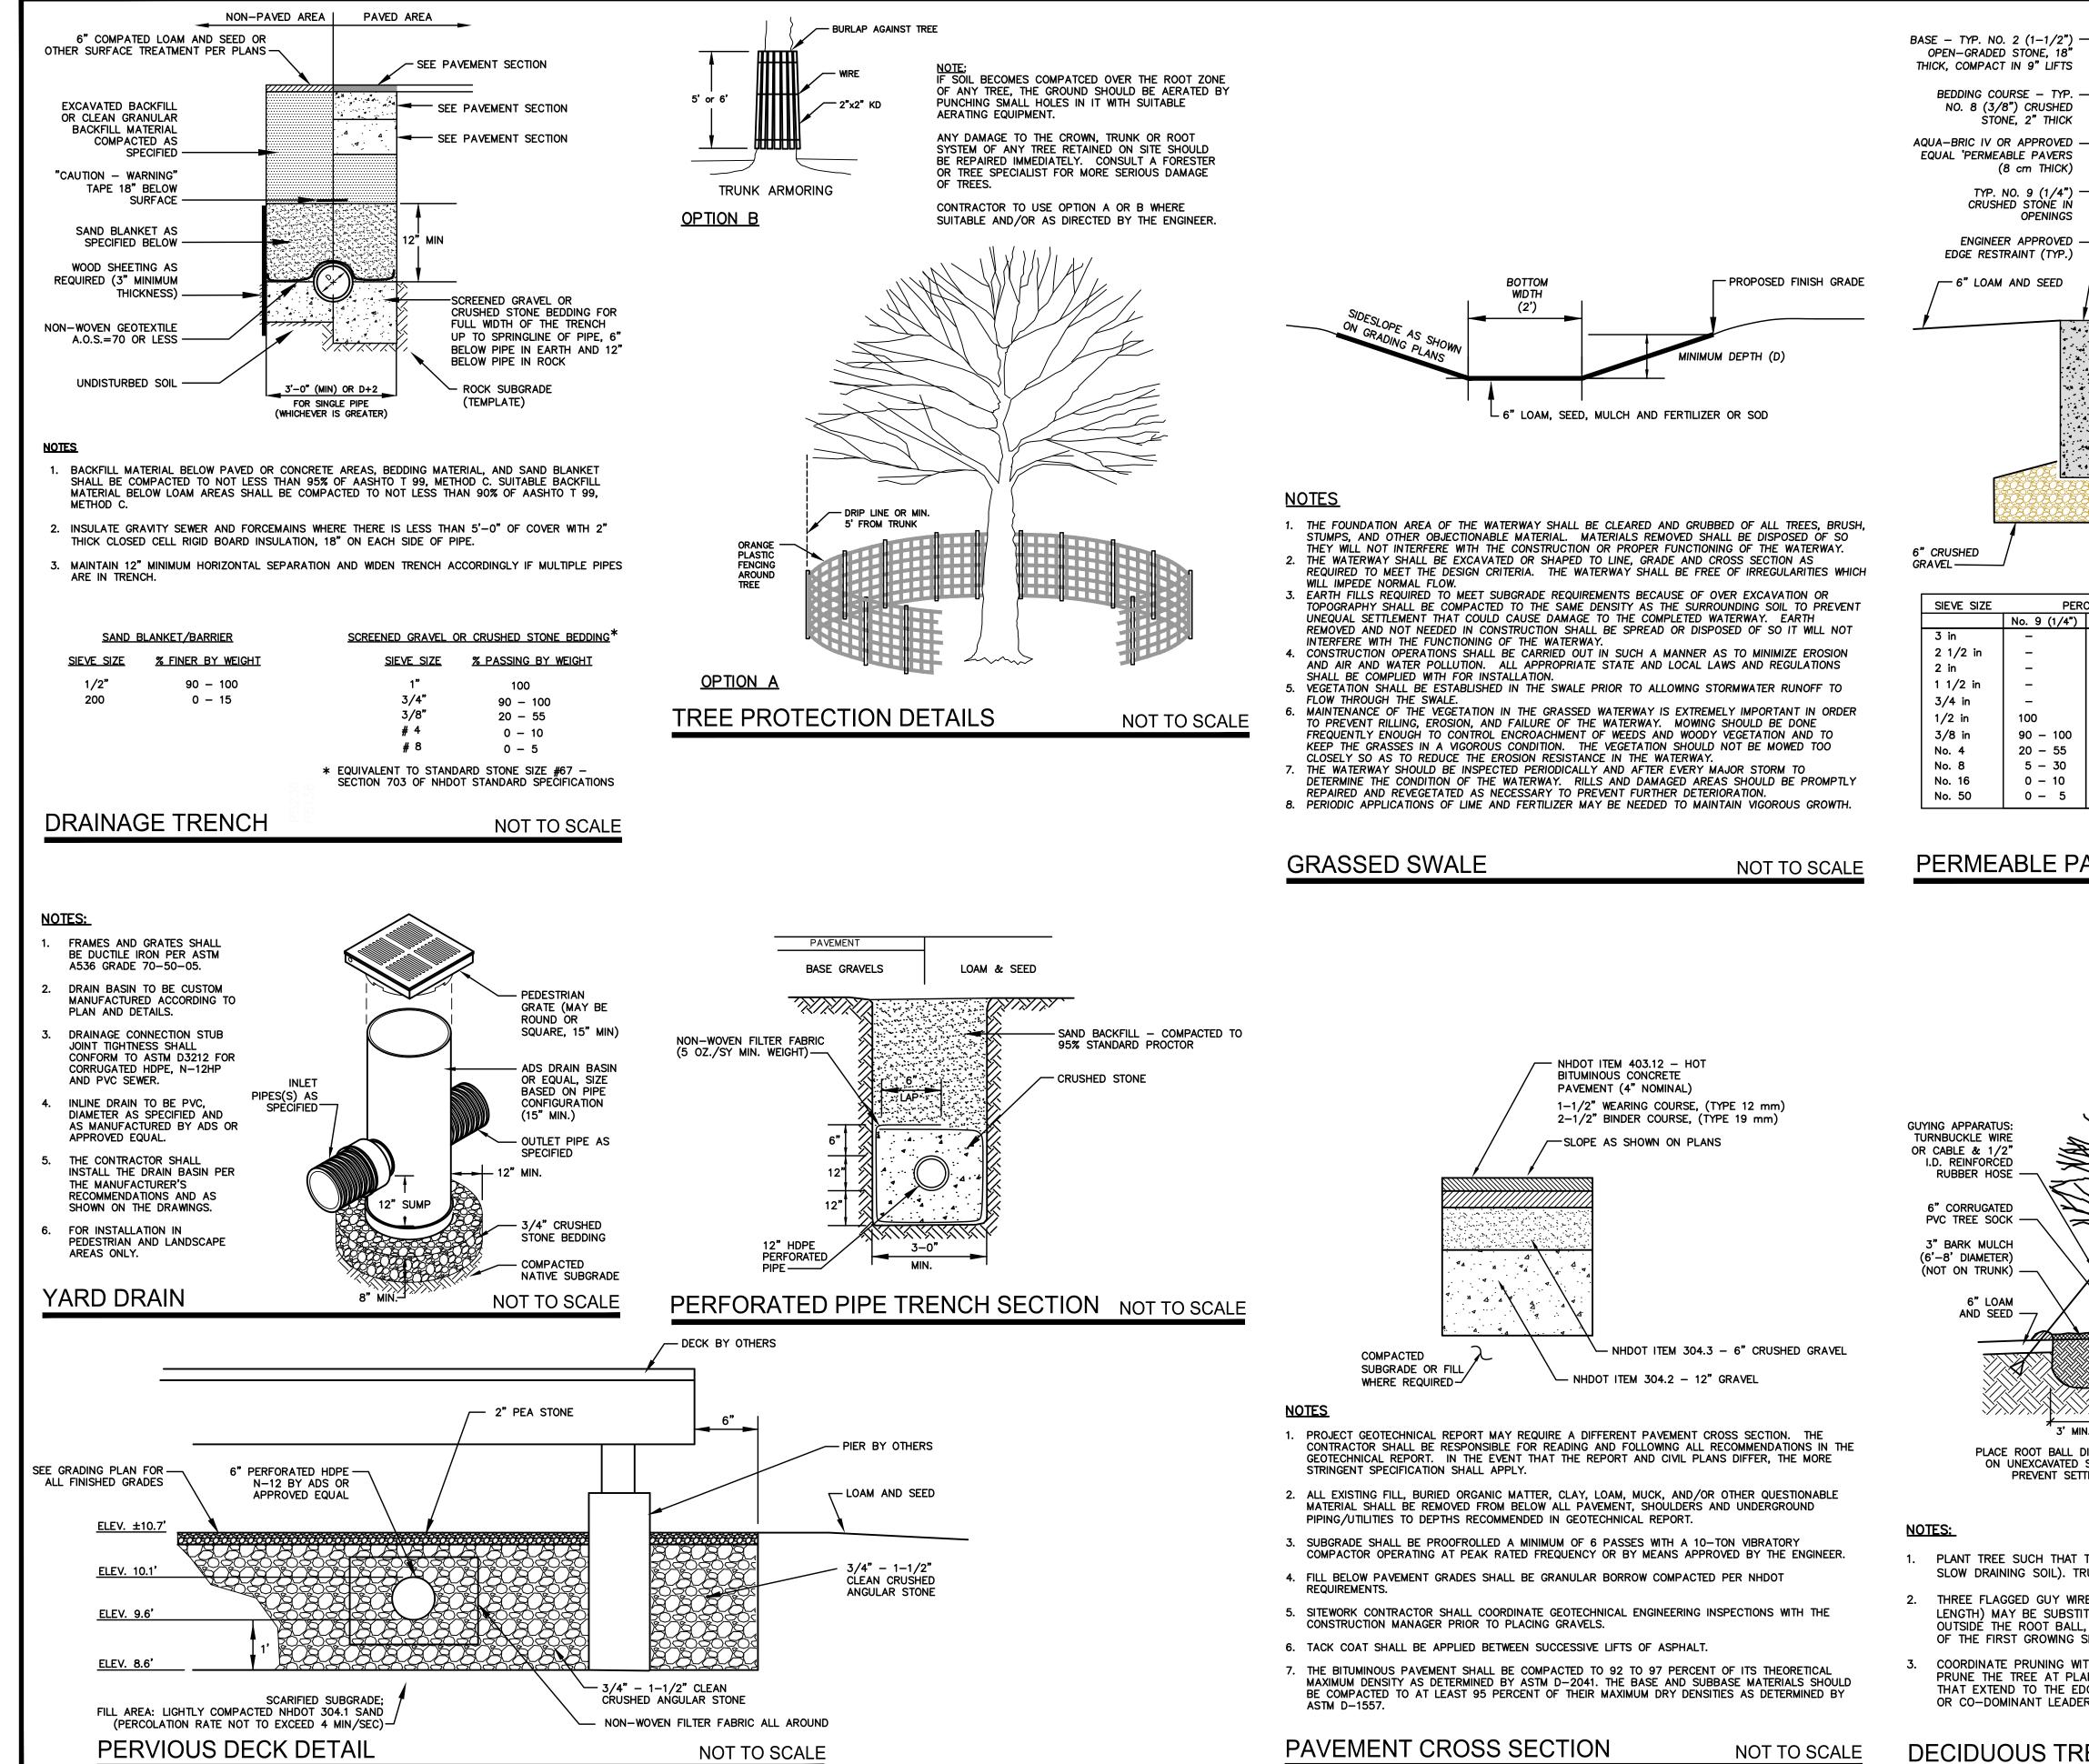

REMOVE THE GRATE. IF USING OPTIONAL ABSORBENTS; REPLACE ABSORBENT WHEN NEAR SATURATION.

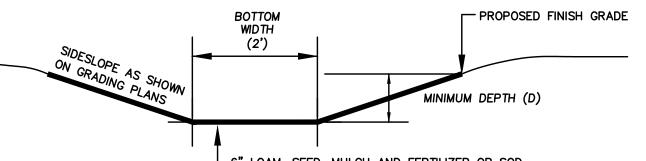

EMPTIED. TO EMPTY THE UNIT, LIFT THE UNIT OUT OF THE INLET USING THE LIFTING STRAPS AND

AND PLACE THE GRATE INTO CATCH BASIN INSERT SO THE GRATE IS BELOW THE TOP STRAPS AND

ABOVE THE LOWER STRAPS. HOLDING THE LIFTING DEVICES, INSERT THE GRATE INTO THE INLET.
